If we stepped down 400 kV/33 kV then the current would be 12 to 13 times higher and the wires would have to be correspondingly heavier to transmit power at low voltage level of 33 kV. The 400 kV/33 kV Transformer would be impractical. If we assume a core type Transformer as is mostly the case, we have two limbs. We cannot wind the entire 400 kV winding in one limb and the other 33 kV winding ...

The 315 MVA transformers step down the voltage from 400 KV to 220 KV. 6% of the input power 680 MW i.e. around 40 MW power is lost in the transformers. The rest i.e.640 MW is fed to the 220 KV busbar (double main and transfer bus scheme). To increase the reliability of the system the 220 KV busbar is also fed from 2 other substations.

The modernization of industrial power systems has been stifled by industry's acceptance of extremely outdated practices. Industry is hesitant to depart from power system design practices influenced by the economic concerns and technology of the post World War II period. In order to break free of outdated techniques and ensure product quality and continuity of operations, engineers must apply novel techniques to plan, design, and implement electrical power systems. Based on the author's 40 years of experience in Industry,

Industrial Power Systems illustrates the importance of reliable power systems and provides engineers the tools to plan, design, and implement one. Using materials from IEEE courses developed for practicing engineers, the book covers relevant engineering features and modern design procedures, including power system studies, grounding, instrument transformers, and medium-voltage motors. The author provides a number of practical tables, including IEEE and European standards, and design principles for industrial applications. Long overdue, Industrial Power Systems provides power engineers with a blueprint for designing electrical systems that will provide continuously available electric power at the quality and quantity needed to maintain operations and standards of production.
