This book covers the  
basics of modern  
probability theory. It  
begins with probability  
theory on finite and  
countable sample  
spaces and then  
passes from there to  
a concise course on  
measure theory,

which is followed by some initial applications to probability theory, including independence and conditional expectations. The second half of the book deals with Gaussian random variables, with Markov chains, with a few continuous parameter

processes, including  
Brownian motion,  
and, finally, with  
martingales, both  
discrete and  
continuous parameter  
ones. The book is a  
self-contained  
introduction to  
probability theory and  
the measure theory  
required to study it.

This is the only book
