This IBM® Redbooks® publication focuses on gathering the correct technical information, and laying out simple guidance for optimizing code performance on IBM POWER8® processor-based systems that run the IBM AIX®, IBM i, or Linux

operating systems. There is straightforward performance

optimization that can be performed with a minimum of effort and without extensive previous experience or in-depth knowledge. The POWER8 processor contains many new and important performance features, such as support for eight hardware

Specific guidance is given
for the POWER8
processor; however, the
general guidance is
applicable to the IBM

POWER6®, IBM
POWER5, and even to
earlier processors. This
guide is directed at

However, this also calls for new approaches to

Web Services In Detail

We often deploy our web
applications into the

cloud, and our code

needs to interact with

many third-party

services. An efficient way

to build applications to

Online Library

Android App

do this is through
microservices
architecture. But, in
practice, it's hard to get
this right due to the
complexity of all the
pieces interacting with
each other. This book
will teach you how to
overcome these issues
and craft applications
that are built as small
standard units, using all
the proven best practices

Online Library

and avoiding the usual traps. It's a practical book: you'll build

everything using Python 3 and its amazing tooling ecosystem. You will understand the principles of TDD and apply them. You will use Flask, Tox, and other tools to build your services using best practices. You will learn how to secure connections between

services, and how to script Nginx using Lua to build web application firewall features such as rate limiting. You will also familiarize yourself with Docker's role in microservices, and use Docker containers, CoreOS, and Amazon Web Services to deploy your services. This book will take you on a journey, ending with the

Online Library
