This part of JR/T 0025 describes relevant information on how to implement the low-value payment function (i.e. electronic cash) on a debit/credit card AND provides a functional overview of electronic cash, including card applications, terminal functions, and issuer system example, AND the background account processing of the issuer is beyond the scope of this part.

Research of discrete event systems is strongly motivated by applications in flex ible manufacturing, in traffic control and in concurrent and real-time software verification and design, just to mention a few important areas. Discrete event system theory is a promising and dynamically developing area of both control theory and computer science. Discrete event systems are systems with non-numerically-valued states, inputs, and outputs. The approaches to the modelling and control of these systems can be roughly divided into two groups. The first group is concerned with the automatic design of controllers from formal specifications of logical requirements. This re search owes much to the pioneering work of P.J. Ramadge and W.M. Wonham at the beginning of the eighties. The second group deals with the analysis and op timization of system throughput, waiting time, and other performance measures for discrete event systems. The present book contains selected papers presented at the Joint Workshop on Discrete Event Systems (WODES'92) held in Prague, Czechoslovakia, on Au gust 26-28, 1992 and organized by the Institute of Information Theory and Au tomatom of the Czechoslovak Academy of Sciences, Prague, Czechoslovakia, by the Automatic Control Laboratory of the Swiss Federal Institute of Technology (ETH) . Zurich, Switzerland, and by the Department of Computing Science of the University of Groningen. Groningen, the Netherlands.

Readers will find here a book that constitutes the thoroughly refereed post-proceedings of the First International Conference on Test and Proofs, held in Zurich, Switzerland in February 2007. The 12 revised full papers presented were carefully reviewed and selected for inclusion in the book. The papers are devoted to the convergence of software proofing and testing and feature current research work that combines ideas from both sides to foster software quality.

This volume contains the papers presented at the Eighth International C- ferenca on Logic for Programming, Arti/fcial Intelligence and Reasoning (LPAR 2001), held on December 3-7, 2001, at the University of Havana (Cuba), together with the Second International Workshop on Implementation of Logics. There were 112 submissions, of which 19 belonged to the special subm- sion category of experimental papers, intended to describe implementations or comparisons of systems, or experiments with systems. Each submission was - viewed by at least three program committee members and an electronic program committee meeting was held via the Internet. The high number of submissions caused a large amount of work, and we are very grateful to the other 31 PC members for their e?iciency and for the quality of their reviews and discussions. Finally, the committee decided to accept 40papers in the theoretical ca- gory, and 9 experimental papers. In addition to the refereed papers, this volume contains an extended abstract of the invited talk by Frank Wolter. Two other invited lectures were given by Matthias Baaz and Manuel Hermenegildo. Apart from the program committee, we would also like to thank the other people who made LPAR 2001 possible: the additional referees: the Local Arran-` gements Chair Luciano Garc ??a; Andr ?es Navarro and Oscar Guell, ? who ran the internet-based submission software and the program committee discussion so- ware at the LSI Department lab in Barcelona; and Bill McCune, whose program committee management software was used.

This book reports on advanced theories and methods in two related engineering fields: electrical and electronic engineering, and communications engineering and computing. It highlights areas of global and growing importance, such as renewable energy, power systems, mobile communications, security and the Internet of Things (IoT). The contributions cover a number of current research issues, including smart grids, photovoltaic systems, wireless power transfer, signal processing, 4G and 5G technologies, IoT applications, mobile cloud computing and many more. Based on the proceedings of the Second International Conference on Emerging Trends in Electrical, Electronic and Communications Engineering (ELECOM 2018), held in Mauritius from November 28 to 30, 2018, the book provides graduate students, researchers and professionals with a snapshot of the state-of-the-art and a source of new ideas for future research and collaborations.

Special Edition Using TCP/IP, 2E is the practical guide to applications of TCP/IP, including utilities for operation, troubleshooting, and management, with insight into future applications such as Voice over IP and VPNs. It includes current TCP/IP draft standards and future work planned. Clear illustrations of practical utilities enable the reader to understand both the technology and applications together from a single source. It includes current scaling problems in the Internet like addressing and routing. Both short-term solutions and long-term solutions for these problems are discussed.

The EU-NATO relationship continues to develop at a time of significant change for both organizations. Post 9/11, NATO embarked on a fundamental transformation, recasting itself as an organization with global strategic reach and interest, focused less on Europe than ever before. At the same time, the EU is also becoming a more global political actor. Consequently, there is growing evidence that over time the EU will take the primary place in providing military security in Europe. This volume combines political and legal methods to provide a comprehensive analysis of the current and likely future relationship between the EU and NATO. The work will be of interest to all those interested in the development of these two major organizations and international security more generally, whether from a political or legal perspective.

Photography legend John Shaw returns with his much-anticipated guide to digital nature photography, complete with more than 250 extraordinarily beautiful photographs. For over four decades, John Shaw's authentic voice and trusted advice has helped photographers achieve impressive shots in the great outdoors. In his first-ever book on digital photography, Shaw provides in-depth advice on everything from equipment and lenses to thorough coverage of digital topics including how to use the histogram. In addition, he offers inspirational and frank insight that goes far beyond the nuts and bolts of photography, explaining that successful photos come from having a vision, practicing, and then acquiring the equipment needed to accomplish the intention. Easily digestible and useful for every type of photographer, and complete with more than 250 jaw-dropping images, John Shaw's Guide to Digital Nature Photography is the one book you'll need to beautifully capture the world around you.

New Instruments for Environmental Policy in the EU provides a comprehensive analysis of the debate over new forms of environmental regulation in the European Union. The conclusions draw attention to critical aspects of instrument design, as well as the difficulty of accommodating national policy diversity without contravening EU and international trade rules. Drawing on critical research and practical experience, this book presents a number of recommendations for improving the next generation of environmental policies and explores comparisons between the search for new environmental instruments in the EU and similar regulatory transitions worldwide.
