The aim of this book is to present as completely as possible a description of the joints of the human limbs, using photographs and drawings of anatomical dissections. Existing descriptive anatomical accounts are often theoretical and not linked to functional activity of the joints concerned; they lack practical demonstration of the anatomy. We hope to fill the gap in the available literature by presentation of this book. The work is directed towards anatomists, doctors interested in joint pathology, orthopaedic surgeons, rheumatologists, radiologists, specialists in sport injuries and rehabilitation, also to physicians in general, physiotherapists and students. The book is divided into seven chapters. Each chapter comprises two parts: the first is a brief account of the functional anatomy of the joint. It does not offer a complete description but an overall summary of the functional structures involved. The second section, the main part, includes illustrations (drawings and photographs of anatomical dissections). The dissections and the photographs were prepared in the Department of Anatomy directed by Professor HENRI M. DUVERNAY from cadaveric specimens preserved by the method described by WINCKLER (1964). The process of dissecting the ligamentous structures around joints has proved technically difficult. It is easy to create artificially structures from the mass of fibrous tissue and on a number of occasions we have been unable to locate ligaments which are described in some anatomical accounts.

With increasing pressure on resources, the looming spectre of climate change and growing anxiety among eaters, ecology and food are at the heart of the political debates surrounding agriculture and diet. This unique contribution unravels agricultural environmental issues at different spatial levels, from local to global, documenting the major shifts in agriculture from a long-term perspective. The book begins by exploring the changes in the industrialisation and socialisation of agriculture over time, through the lens of institutional economics including The French Regulation School and Conventions Theory. Building on Polanyi's 'Great Transformation', the chapters in this volume analyse long-term and contemporary changes in agriculture and food systems that have occurred throughout the last few centuries. Key chapters focus on the historical changes in provisioning and the social relations of production, consumption, and regulation of food in different socio-political contexts. The

future of agriculture is addressed through an analysis of controversial contemporary political claims and their engagement with strategies that aim to improve the sustainability of agriculture and food consumption. To shed light on ongoing changes and the future of food, this book asks important environmental and social questions and analyses how industrial agriculture has played out in various contexts. It is recommended supplementary reading for postgraduates and researchers in agricultural studies, food studies, food policy, the agri-food political economy and political and economic geography.

Since the beginning of the twentieth century, hundreds of thousands of documents of all sorts have been unearthed in China, opening whole new fields of study and transforming our modern understanding of ancient China. While these discoveries have necessarily taken place in China, Western scholars have also contributed to the study of these documents throughout this entire period. This book provides a comprehensive survey of the contributions of these Western scholars to the field of Chinese paleography, and especially to study of oracle-bone inscriptions, bronze and stone inscriptions, and manuscripts written on bamboo and silk. Each of these topics is provided with a comprehensive narrative history of studies by Western scholars, as well as an exhaustive bibliography and biographies of important scholars in the field. It is also supplied with a list of Chinese translations of these studies, as well as a complete index of authors and their works. Whether the reader is interested in the history of ancient China, ancient Chinese paleographic documents, or just in the history of the study of China as it has developed in the West, this book provides one of the most complete accounts available to date.
