Paul Hugh Emmett was an American chemist best known for his pioneering work in the field of catalysis and for his work on the Manhattan Project during World War II. He spearheaded the research to separate isotopes of uranium and to develop a corrosive uranium gas. Emmett also made significant contributions to BET Theory which explains the relationship between surface area and gas adsorption. He served on the faculty of Johns Hopkins University for 23 years throughout his scientific career.

The gas adsorption technique is based on the Brunauer-Emmett-Teller (BET) model included in the determination of the amount of gas that is adsorbed on the surface of the sample at low temperatures [13]. The specific surface area (m^2/g) defined by this method comprises the outward as well as the internal (open pores) surface area. However, the surface area of closed pores cannot be determined because of its inaccessibility for adsorbing gas molecules.

By making use of the evaporation?condensation properties of liquid mixtures, the Brunauer?Emmett?Teller theory of multimolecular adsorption is extended to mixtures of gases. No satisfactory experimental data are available at the present time with which to test the theory.

Brunauer–Emmett–Teller theory aims to explain the physical adsorption of gas molecules on a solid surface and serves as the basis for an important analysis technique for the measurement of the specific surface area of materials. The observations are very often referred to as physical adsorption or physisorption. In 1938, Stephen Brunauer, Paul Hugh Emmett, and Edward Teller published the first article about the BET theory in the Journal of the American Chemical Society. The BET theory ...

The Brunauer–Emmett–Teller (BET) equation (Brunauer et al., 1938) overcomes the limitation to a monolayer of sorbate and currently is a commonly used model to describe the multilayer adsorption of gas molecules on a sorbent (Brunauer et al., 1938). For water adsorption, the BET equation can be written as
