Developing Assessments for the Next 4

Generation Science Standards develops an approach to science assessment to meet the vision of science education for the future as it has been elaborated in A Framework for K-12 Science Education (Framework) and Next Generation Science Standards (NGSS). These documents are brand new and the changes they call for are barely under way, but the new assessments will be needed as soon as states and districts begin the process of implementing the NGSS and changing their approach to science education. The new Framework and the NGSS are designed to guide educators in significantly altering the way K-12 science is taught. The Framework is aimed at making science education more closely resemble the way scientists actually work and think, and making instruction reflect research on learning that demonstrates the importance of building coherent understandings over

Get Free California Progress Monitoring

time. It structures science education around three dimensions - the practices through which scientists and engineers do their work, the key crosscutting concepts that cut across disciplines, and the core ideas of the disciplines - and argues that they should be interwoven in every aspect of science education, building in sophistication as students progress through grades K-12. Developing Assessments for the Next Generation Science Standards recommends strategies for developing assessments that yield valid measures of student proficiency in science as described in the new Framework. This report reviews recent and current work in science assessment to determine which aspects of the Framework's vision can be assessed with available techniques and what additional research and development will be needed to support an assessment system that fully meets that vision. The report offers a systems approach

Get Free California Progress Monitoring

to science assessment, in which a range of assessment strategies are designed to answer different kinds of questions with appropriate degrees of specificity and provide results that complement one another. Developing Assessments for the Next Generation Science Standards makes the case that a science assessment system that meets the Framework's vision should consist of assessments designed to support classroom instruction, assessments designed to monitor science learning on a broader scale, and indicators designed to track opportunity to learn. New standards for science education make clear that new modes of assessment designed to measure the integrated learning they promote are essential. The recommendations of this report will be key to making sure that the dramatic changes in curriculum and instruction signaled by Framework and the NGSS reduce inequities in science education

and raise the level of science education for all students.

The purpose of this study was to analyze the effectiveness of progress monitoring in an elementary school, as 16 second through fifth-grade students participated in Response to Intervention (RTI) nine-month small group instruction intervention in reading comprehension and fluency. This study examined the following research question: "What does student progress monitoring tell educators about the effectiveness of a Response to Intervention multi-tiered system of support with second through fifth-grade students who have IEPs and who have been referred for additional support through a Student Study Team process?" The dependent variable was the tracking and analysis of students' literacy skills over the school year on a trimester basis as recorded on the AIMSweb research-based assessment

Get Free California Progress Monitoring

for monitoring literacy performance and progress. Results indicate that participating students experienced notable yet varying progress students in reading comprehension and fluency over the course of a school year. Data suggest that progress needed to be monitored on at least the trimester basis employed in this study to accurately capture students' growth in reading achievement. Progress monitoring assessment that followed the two-week winter break or a week break led to depressed performances for some students. Students had better results when they were assessed following periods of regular instruction without break or when assessed at the end rather than the beginning of a week.

California Treasures is a research-based reading and language arts program for Grades K-6 that: builds a lifelong love of reading through explicit systematic

Nitrogen is indispensable to all life on Earth. However, humans now dominate the nitrogen cycle, and nitrogen emissions from human activity have real costs: water and air pollution, climate change, and detrimental effects on human health, biodiversity, and natural habitats. Too little nitrogen limits ecosystem processes, while too much nitrogen transforms ecosystems profoundly. The California Nitrogen Assessment is the first comprehensive account of nitrogen flows, practices, and policies for California, encompassing all nitrogen flows—not just those associated with agriculture—and their impacts on ecosystem services and human wellbeing. How California handles nitrogen issues will be of interest nationally and internationally, and the goal of the assessment is to link science with action and to produce information that affects both

Get Free California Progress Monitoring

future policy and solutions for addressing nitrogen pollution. This book also provides a model for application of integrated ecosystem assessment methods at regional and state (subnational) levels.
