North Holland has dozens of historic town centres that are worth visiting. The most well-known is obviously the historic centre of Amsterdam, which became a UNESCO World Heritage Site in 2010. Its characteristic architecture and lovely canals (known as grachten) demand some pictures to be taken. But there are a lot more of them in the province — every region of North Holland at least has one ...

As the world hurtles towards environmental oblivion, China is leading the charge. 'Cancer villages' have sprung from poisoned farmlands, unregulated chemical dumps have been exploding and water and food have been contaminated. With a poor record on industrial safety, China's plans to widely adopt nuclear power are terrifying the world. Richard Smith looks into why this ecological apocalypse is so much worse than under 'normal' capitalism. Absurdly, Xi Jinping's police-state is incapable of suppressing pollution in its own industries. Since the Communist Party's rulers depend upon the state-owned economy for their wealth and power, they subvert their own market reforms, meaning China suffers the worst of both worlds - irrational Stalinist bureaucratic tendencies mixed with

the blind growth of capitalist market demand. Corruption is rife, there is no rule of law, and since cutting pollution means cutting jobs, more often than not Beijing allows industries to pollute to meet its growth targets. The only way to stop China's drive to collapse is to slam the brakes on its ceaseless overproduction and to revolutionise its economy on the basis of social need and sustainability instead of profit.

This document provides the comprehensive list of Chinese Industry Standards - Category: JT; JT/T; JTT.

This book constitutes the proceedings of the 15 Chinese Lexical Semantics Workshop, CLSW 2014, held in Macau, China, in June 2014. The 41 regular and 3 short papers included in this volume were carefully reviewed and selected from 139 submissions. They are organized in topical sections named: lexical semantics; applications on natural language processing; and lexical resources and corpus linguistics.

This book analyzes the rise of China's naval power and its possible strategic consequences from a wide variety of perspectives – technological, economic, and geostrategic – while employing a historical-comparative approach throughout. Since naval development requires huge financial resources and mostly takes place within the context of transnational industrial partnerships, this study also consciously adopts an industry perspective. The systemic problems involved in warship production and the associated material, financial, technological, and political requirements currently remain overlooked

aspects in the case of China. Drawing on first-hand working experience in the naval shipbuilding industry, the author provides transparent criteria for the evaluation of different naval technologies ' strategic value, which other researchers can draw upon as a basis for further research in such diverse fields as International Security Studies, Naval Warfare Studies, Chinese Studies, and International Relations.

This Standard specifies the inspection items, inspection methods, inspection requirements, and the determination, disposal and data archiving of inspection results for safety technology inspection of motor vehicles. This Standard is applicable to the safety technology inspection of motor vehicles by institutions with inspection and testing qualifications. This Standard is also applicable to the safety technology inspection of inbound motor vehicles by institutions engaged in inspection and testing of inbound motor vehicles. Motor vehicles approved for actual road test and motor vehicles temporarily entering the country may receive the safety technology inspection in accordance with this Standard.

China's rise to global economic and strategic eminence, with the potential for achieving pre-eminence in the greater-Asian region, is one of the defining characteristics of the post-Cold War period. This work

offers a basic understanding of the military-strategic basis and trajectory of a rising China, provides background, and outlines current and future issues concerning China's rise in strategic-military influence. The next decade may witness China's assertion of military or strategic pressure on Japan, the Korean Peninsula, India, the South China Sea, the Taiwan Strait, Central Asia, or even on behalf of future allies in Africa and Latin America. While conflict is not a foregone conclusion, as indicated by China's increasing participation in many benign international organizations, it is a fact that China's leadership will pursue its interests as it sees them, which may not always coincide with those of the United States, its friends, and allies. Until now, no single volume has existed that provides an authoritative, comprehensive, and concise description of China's evolving geo-strategy or of how China is transforming its military to carry out this strategy. Fisher examines how China's People's Liberation Army (PLA) remains critical to the existence of the Chinese Communist government and looks at China's political and military actions designed to protect its expanded strategic interests in both the Asia-Pacific and Central to Near-Asian regions. Using open sources, including over a decade of unique interview sources, Fisher documents China's efforts to build a larger nuclear force that may soon be protected by missile defenses, modern high technology systems for space, air, and naval forces, and how China is now beginning to assemble naval, air, and ground forces for future power projection missions. His work also examines how the United States and other governments simultaneously seek greater engagement with China on strategic concerns, while hedging against its rising

power. Although China faces both internal and external constraints on its rise to global eminence, it cannot be denied that China's government is pursuing a far-reaching strategic agenda.
