This revolutionary, user-friendly textbook not only guides social workers in developing competence in the DSM system of diagnosis, it also assists them in staying attuned during client assessment to social work values and principles: a focus on client strengths, concern for the worth and dignity of individuals, appreciation of environmental influences on behavior, and commitment to evidence-informed practice. The authors, seasoned practitioner-scholars, provide an in-depth exploration of fourteen major mental disorders that social workers commonly see in practice, including anxiety disorders, depression, bipolar disorder, and schizophrenia. They skillfully integrate several perspectives in order to help practitioners meet the challenges they will face in client assessment. A risk and resilience framework helps social workers understand environmental influences on the emergence of mental disorders and the strengths that clients already possess. Social workers will also learn to apply critical thinking to the DSM when it is inconsistent with social work values and principles. Finally, the authors catalog the latest evidence-based assessment instruments and treatments for each disorder so that social workers can intervene efficiently and effectively, using the best resources available. Students and practitioners alike will appreciate the wealth of case examples, evidence-based assessment instruments, treatment plans, and new social diversity sections that make this an essential guide to the assessment and diagnostic processes in social work practice.

"This much-needed volume brings to the clinician or student some of the best critical-minded analysis by some of the most insightful thinkers about psychiatric diagnosis today. The thought-provoking questions these essays raise, and the multifaceted and provocative answers they provide, cultivate sensitivity to the nuances of diagnostic assessment that often makes the difference between clinical success and failure." - Jerome C. Wakefield, PhD, DSW, New York University Silver School of Social Work, New York This transformative resource challenges social workers and mental health professionals to rethink their approaches to assessment and diagnosis from the ground up. Topics include: The DSM-5 definition of mental disorder: critique and alternatives. Making assessment decisions: macro, mezzo, and micro perspectives. Neuroscience, resilience, and the embodiment of “mental” disorder. Narrative, psychodynamic, and cultural conceptualizations of disorder. Person-centered and contextualized diagnosis in mental health. Meeting the challenge of teaching integrated assessment. Automatic Speech Signal Analysis for Clinical Diagnosis and Assessment of Speech Disorders provides a survey of methods designed to aid clinicians in the diagnosis and monitoring of speech disorders such as dysarthria and dyspraxia, with an emphasis on the signal processing techniques, statistical validity of the results presented in the literature, and the appropriateness of methods that do not require specialized equipment, rigorously controlled recording procedures or highly skilled personnel to interpret results. Such techniques offer the promise of a simple and cost-effective, yet objective, assessment of a range of medical conditions, which would be of great value to clinicians. The ideal scenario would begin with the collection of examples of the clients’ speech, either over the phone or using portable recording devices operated by non-specialist nursing staff. The recordings could then be analyzed initially to aid diagnosis of conditions, and subsequently to monitor the clients’ progress and response to treatment. The automation of this process would allow more frequent and regular assessments to be performed, as well as providing greater objectivity.

Autism spectrum disorder has received increasing research in recent years, with more information on assessment and treatment than can be readily assimilated from primary literature by clinicians. Clinical Assessment and Intervention for Autism Spectrum Disorders summarizes evidence-based assessments and intervention for Autism across the life-span, providing clinicians with a practical overview of how best to assess and treat this disorder. The book begins with a discussion of what warrants a determination of being “evidence based” and a description of the disorder from a life span perspective.
