### Code For Sustainable Homes Technical Guide

Code for Sustainable Homes Introduced in 2007 the Code is a voluntary government standard for assessing the sustainability of new housing in England, Wales and Northern Ireland.

The Government's Code for Sustainable Homes is a national environmental assessment method for rating and clarifying the performance of new homes in key areas such as carbon dioxide emissions and water use. It will be mandatory from 1 May 2008. This title sets out the requirements for the Code, and the process for achieving a Code assessment.

'Code for Sustainable Homes' provides a comprehensive measure of the sustainability of new homes, ensuring that sustainable homes deliver real improvements, in key areas such as carbon dioxide emissions and water use.

In this report the Department for Communities and Local Government (DCLG) is urged to reconsider plans to axe a policy that has driven up home building standards and helped to create a thriving sustainable building industry in the UK. The Environmental Audit Committee criticises the Department for its decision to remove local authorities' discretion to set high standards on energy and water saving-using the Code for Sustainable Homes (CSH)-in favour of a lowest-common-denominator national standard. DCLG's proposed needs test on the application of sustainability standards by local authorities also risks becoming a lawyers' charter, could curtail local choice, delay the construction of new homes and compel local authorities to incur unnecessary legal fees. DCLG also failed to take into account the latest evidence on the declining capital costs of fitting clean energy technology to homes in its Housing Standards Review, and the 2016 zero carbon homes standard has been successively watered down. The CSH is a proven policy mechanism for driving incremental improvements in sustainable home building. Lower-level CSH standards on energy use have been successfully embedded in Building Regulations over the six years since the policy was introduced. DCLG has not set out a replacement mechanism to drive sustainability in the future. The Committee recommends that DCLG: examines the latest research on the decreasing cost of clean energy technologies; maintains and refreshes the CSH as a tool for local authorities to lever in sustainability; retains CSH standards on sustainable construction materials to support green exports and green growth.

Offers the information to support the Government's Code for Sustainable Homes, the national environmental assessment method for rating and clarifying the performance of new homes. This guide is suitable for construction professionals wanting to understand the technical background to and process of achieving a Code rating for new build homes.

Materials for Architects and Builders provides a clear and concise introduction to the broad range of materials used within the construction industry and covers the essential details of their manufacture, key physical properties, specification and uses. Understanding the basics of materials is a crucial part of undergraduate and diploma construction or architecture-related courses, and this established textbook helps the reader to do just that with the help of colour photographs and clear diagrams throughout. This new edition has been completely revised and updated to include the latest developments in materials research, new images, appropriate technologies and relevant legislation. The ecological effects of building construction and lifetime use remain an important focus, and this new edition includes a wide range of energy saving building components.

This second volume in the Technologies of Architecture series - the only series of books tuned to the architectural technology syllabus - explores the environmental influences on building design. Looking particularly at sustainable building, a holistic view is taken, so that the influence of any one set of choices on other areas - such as the trade-off of daylighting against thermal insulation, or the balance needed between heating and ventilation - are not overlooked. The authors discuss available technologies for establishing a suitable microclimate within buildings, for managing the transmission of sound and for minimizing the exploitation of scarce energy and of other resources. Using the perspective of a designer who needs a sound scientific basis for arriving at the optimum outcome, this valuably informative volume is ideal for architectural technology students, as well as first and second year architecture students.
