As business cycles speed up,
many customers gain
significant competitive
advantage from quicker and

more accurate business decision-making by using real data. For many customers, choosing the path to co-locate their transactional and analytical workloads on System z® better leverages their

Access Free Cognos Framework Manager

Installation Guide
Developer Home

existing investment in hardware, software, and skills. We created a project to address a number of best practice questions on how to manage these newer, analytical type workloads, especially when co-located

Access Free Cognos Framework Manager

Installation Guide

transactional workloads. The goal of this IBM® Redbooks® publication is to provide technical guidance and performance trade-offs associated with resource management and potentially

Access Free Cognos Framework Manager

DB2® data-sharing in a variety of mixed transactional / data warehouse System z topologies. The term co-location used here and in the rest of the book is specifically defined as the

Access Free Cognos Framework Manager

practice of housing both transactional (OLTP) and data warehouse (analytical) workloads within the same System z configuration. We also assumed that key portions of the transactional and data

Access Free Cognos Framework Manager

Installation Guide
Developer Home

warehouse databases would reside on DB2 for z/OS®. The databases may or may not reside in a DB2 data-sharing environment; we discuss those pros and cons in this book. The intended audience includes DB2 data warehouse

architects and practitioners who are facing choices in resource management and system topologies in the data warehouse arena. This specifically includes Business Intelligence (BI) administrators, DB2 database

z/OS performance
administrators / systems
programmers. In addition,
decision makers and
architects can utilize this
book to assist in making

topology decisions. The book is divided into four parts. Part I, "Introducing the collocation project" covers the System z value proposition and why one should consider System z as the central platform for their data

warehousing / business
analytics needs. Some topics
are risk avoidance via data
consolidation, continuous
availability, simplified
disaster recovery, IBM Smart
Analytics Optimizer, reduced
network bandwidth

general pros and cons of each. This would be useful input for an architect to understand where a customer is today and where they might consider moving to. Part II, "Project environment" covers the

environment consisted of a
