Because of the Moon ' s unique place in the evolution of rocky worlds, it is a prime focus of NASA ' s space exploration vision. Currently NASA is defining and implementing a series of robotic orbital and landed missions to the Moon as the initial phase of this vision. To realize the benefits of this activity, NASA needs a comprehensive, well-validated, and prioritized set of scientific research objectives. To help establish those objectives, NASA asked the NRC to provide guidance on the scientific challenges and opportunities enabled by sustained robotic and human exploration of the Moon during the period 2008-2023 and beyond. This final report presents a review of the current understanding of the early earth and moon; the identification of key science concepts and goals for moon exploration; an assessment of implementation options; and a set of prioritized lunar science concepts, goals, and recommendations. An interim report was released in September 2006.

In February 2004, the President announced a new goal for NASA; to use humans and robots together to explore the Moon, Mars, and beyond. In response to this initiative, NASA has adopted new exploration goals that depend, in part, on solar physics research. These actions raised questions about how the research agenda recommended by the NRC in its 2002 report, *The Sun to the Earth and Beyond*, which did not reflect the new exploration goals, would be affected. As a result, NASA requested the NRC to review the role solar and space physics should play in support of the new goals. This report presents the results of that review. It considers solar and space physics both as aspects of scientific exploration and in support of enabling future exploration of the solar system. The report provides a series of recommendations about NASA's Sun-Earth Connections program to enable it to meet both of those goals.

The concept of utilizing big data to enable scientific discovery has generated tremendous excitement and investment from both private and public sectors over the past decade, and expectations continue to grow. Using big data analytics to identify complex patterns hidden inside volumes of data that have never been combined could accelerate the rate of scientific discovery and lead to the development of beneficial technologies and products. However, producing actionable scientific knowledge from such large, complex data sets requires statistical models that produce reliable inferences (NRC, 2013). Without careful consideration of the suitability of both available data and the statistical models applied, analysis of big data may result in misleading correlations and false discoveries, which can potentially undermine confidence in scientific research if the results are not reproducible. In June 2016 the National Academies of Sciences, Engineering, and Medicine convened a workshop to examine critical challenges and opportunities in performing scientific inference reliably when working with big data. Participants explored new methodologic developments that hold significant promise and potential research program areas for the future. This publication summarizes the presentations and discussions from the workshop.

Presents new, tested experiments related to the intriguing field of physical science. The experiments are designed to promote interest in science in and out of the classroom, and to improve critical-thinking skills.

Consistent with previous editions of *An Introduction to Physical Science*, the goal of the new Fourteenth edition is to stimulate students' interest in and gain knowledge of the physical sciences. Presenting content in such a way that students develop the critical reasoning and problem-solving skills that are needed in an

ever-changing technological world, the authors emphasize fundamental concepts as they progress through the five divisions of physical sciences: physics, chemistry, astronomy, meteorology, and geology. Ideal for a non-science major's course, topics are treated both descriptively and quantitatively, providing instructors the flexibility to emphasize an approach that works best for their students. Is God a Myth? Like several myths of the pre-science and pre-mathematics era, is god a myth of the "pre-Mentomatics" age? As Mathematics explained the laws of the external physical world, will a new science called Mentomatics explain the laws of an internal world of our mind and brain? Like mathematics became the language of the physical science, will Mentomatics be the language of Spiritual science? After the industrial and information revolution, will Mentomatics usher in the spiritual revolution? Will we, the believers of god, then look as foolish as the people who believed that the earth was flat? And that you could fall off the edge of the earth into hell? God in Two Minutes by Prem Kamble dwells on several such questions. It looks at the past and possible future of God and Religion as has never been done before. It is based on completely original thoughts, not based on anything you have read or heard anywhere before. Though consistent with most religions, it challenges some of our basic beliefs. When our strong beliefs like the flat-earth theory have been proved wrong, it is possible that some of our deepest faiths today may prove to be myths.
