One of the greatest mysteries in reconstructing the history of life on Earth has been the apparent absence of fossils dating back more than 550 million years. We have long known that fossils of sophisticated marine life-forms existed at the dawn of the Cambrian Period, but until recently scientists had found no traces of Precambrian fossils. The quest to find such traces began in earnest in the mid-1960s and culminated in one dramatic moment in 1993 when William

Schopf identified fossilized microorganisms three and a half billion years old. This startling find opened up a vast period of time--some eighty-five percent of Earth's history--to new research and new ideas about life's beginnings. In this book, William Schopf, a pioneer of modern paleobiology, tells for the first time the exciting and fascinating story of the origins and earliest evolution of life and how that story has been unearthed. Gracefully blending his personal story of discovery with the basics needed to understand the astonishing science he describes, Schopf has produced an introduction to paleobiology for the interested reader as well as a primer for beginning students in the field. He considers such questions as how did primitive bacteria, pond scum, evolve into the complex life-forms found at the beginning of

the Cambrian Period? How do scientists identify ancient microbes and what do these tiny creatures tell us about the environment of the early Earth? (And, in a related chapter, Schopf discusses his role in the controversy that swirls around recent claims of fossils in the famed meteorite from Mars.) Like all great teachers, Schopf teaches the non-specialist enough about his subject along the way that we can easily follow his descriptions of the geology, biology, and chemistry behind these discoveries. Anyone interested in the intriguing questions of the origins of life on Earth and how those origins have been discovered will find this story the best place to start.

key to the deadliest weapon ever created: a plague which was brought to earth long ago in the legendary Pandora ' s Box. But Lara soon realises she isn't the only one to have made this discovery. A terrorist group, whose only agenda is destruction, has also learnt of the weapon's existence. The only man who can help her stop the terrorists is the one man to whom she has ever trusted her heart: Terry Sheridan, a former Royal Marine, now a mercenary who sells his deadly skills to the highest bidder. He betrayed Lara once before and it almost cost her life. Now, with the fate of the world hanging in the balance, Lara Croft must trust Sheridan once again. And watch him closely, lest he betray her - and civilisation itself - one last, catastrophic time.

The Cradle of Humankind World Heritage Site situated in the heart of the Magaliesberg Biosphere Reserve is the jewel in South Africa ' s evolutionary crown: an area ' of outstanding universal value ' , it has attracted world-wide interest and furnished key evidence about where, when and how we came to be. The greater Magaliesberg area is peppered with some 200 caves and has a unique geology, history and biodiversity. For decades now, specialists have been combing the area to uncover evidence of our heritage. In his spectacular new title, Vincent Carruthers guides readers along a timeline, from the birth of our planet through to developments of the twenty first century. Along the way he documents the formation of our landscapes and the emergence of life, the rise of hominins, the stone and

Manifestation - The Secrets to Life Transformation & Self Discovery Many of us are beginning to realize that to get more out of life, we first have to become more. As the powerful Law of Attraction states 'like attracts like'. For this reason self-development and motivation is becoming an increasingly important part of our lives. Just as regular exercise enables us to enjoy the physical side of life. Self-help and personal development can help us find longer lasting fulfillment and happiness. Most of us take the path to self-

development once we become tired of our current state of affairs. Maybe we don't have our dream partner, or our career sucks, perhaps we have little financial freedom or feel depressed and unhappy. Whatever the external symptoms are, we can begin to remedy these and get more of what we want by learning to Manifest the potential which lies within each and every one of us. The good news is that the personal transformation we seek is available to everyone who desires it. But the right steps need to be taken to make sure we reach this place in the right way. Just as a caterpillar transforms itself into a magnificent butterfly through a inner manifestation, we humans can undergo a similar experience ourselves. This book contains the secrets I have discovered after many years of trial and error in trying to improve my

Extinction is the ultimate fate of all biological species - over 99 percent of the species that have ever inhabited the Earth are now extinct. The long fossil record of life provides scientists with crucial information about when species became extinct, which species were most vulnerable to extinction, and what processes may have brought about extinctions in the geological past. Key aspects of extinctions in the history of life are here reviewed by six leading palaeontologists, providing a source text for geology and biology undergraduates as well as more advanced scholars. Topical issues such as the causes of mass extinctions and

This book is a selective and fascinating history of scientific speculation about intelligent extraterrestrial life. From Plutarch to Stephen Hawking, some of the most prominent western scientists have had quite detailed perceptions and misperceptions about alien civilizations: Johannes Kepler, fresh from transforming astronomy with his work on the shape of planetary orbits, was quite sure alien engineers on the moon were excavating circular pits to provide shelter;

Christiaan Huygens, the most prominent physical scientist between Galileo and Newton, dismissed Kepler's speculations, but used the laws of probability to prove that "planetarians" on other worlds are much like humans, and had developed a sense of the visual arts; Carl Sagan sees clearly that Huygens is a biological chauvinist, but doesn't see as clearly that he, Sagan, may be a cultural/technological chauvinist when he assumes aliens have highly developed technology like ours, but better. Basalla traces the influence of one speculation on the next, showing an unbroken but twisting chain of ideas passed from one scientist to the next, and from science to popular culture. He even traces the influence of popular culture on science--Sagan always admitted how much E. R. Burroughs' Martian novels

influenced his speculations about Mars. Throughout, Basalla weaves his theme that scientific belief in and search for extraterrestrial civilizations is a complex impulse, part secularized-religious, and part anthropomorphic. He questions the common modern scientific reasoning that life converges on intelligence, and intelligence converges on one science valid everywhere. He ends the book by agreeing with Stephen Hawking (usually a safe bet) that intelligence is overrated for survival in the universe, and that we are most likely alone.

Genesis: The Evolution of Biology presents a history of the past two centuries of biology, suitable for use in courses, but of interest more broadly to evolutionary biologists,

geneticists, and biomedical scientists, as well as general readers interested in the history of science. The book covers the early evolutionary biologists-Lamarck, Cuvier, Darwin and Wallace through Mayr and the neodarwinian synthesis, in much the same way as other histories of evolution have done, bringing in also the social implications, the struggles with our religious understanding, and the interweaving of genetics into evolutionary theory. What is novel about Sapp's account is a real integration of the cytological tradition, from Schwann, Boveri, and the other early cell biologists and embryologists, and the coverage of symbiosis, microbial evolutionary phylogenies, and the new understanding of the diversification of life coming from comparative analyses of complete microbial genomes. The book is a history of

theories about evolution, genes and organisms from Lamarck and Darwin to the present day. This is the first book on the general history of evolutionary biology to include the history of research and theories about symbiosis in evolution, and first to include research on microbial evolution which were excluded from the classical neo-Darwinian synthesis.

Bacterial evolution, and symbiosis in evolution are also excluded from virtually every book on the history of biology.
