Steel classification according to EN 10027-2. Designation systems for steels.

### SteelNumber - EN 10027 - Designation systems for steels

EN 10027 means that all these steel plates have names that described many of their physical qualities precisely Steels produced to EN standards - for example pressure vessel steels such as P355 or  
structural steels S275 have names that tell you a lot about the steel without having to look the details up in the relevant standard.

### A Guide to EN 10027 Steel Names - Oakley Steel

In addition to the descriptive steel grade naming system indicated above, within EN 10027-2 is defined a system for creating unique steel grade numbers. While less descriptive and intuitive than the  
grand names they are easier to tabulate and use in data processing applications. The number is in the following format: x.yzz (zz)

A necessary purchase for level 1 and 2 undergraduates studying building/ construction materials modules, Materials for Architects and Builders provides an introduction to the broad range of materials used within the construction industry and contains information pertaining to their manufacture, key physical properties, specification and uses. Construction Materials is a core module on all undergraduate and diploma construction-related courses and this established textbook is illustrated in colour throughout with many photographs and diagrams to help students understand the key principles. This new edition has been completely revised and updated to include the latest developments in materials, appropriate technologies and relevant legislation. The current concern for the ecological effects of building construction and lifetime use are reflected in the emphasis given to sustainability and recycling. An additional chapter on sustainability and governmental carbon targets reinforces this issue.

Designing and constructing load-bearing building elements Columns, walls and floors make up the skeleton of nearly every building. This third volume in the series SCALE, Support| Materialise, takes an in-depth look at these load-bearing structures, covering the development and realization of appropriate constructions from idea and design intention all the way to constructional implementation. Following the traditional building methods of massive, cross-wall, and skeleton construction, it points the way toward a material-appropriate constructional approach to these defining structural

elements – columns, walls, and floors. Special attention is given to how constructional and technical considerations can be harmonized with spatial and formal commitments. The load-bearing elements are organized, described, and explored in detail from a material as well as a formal and constructional perspective. Their practical implementation is illustrated by a series of international examples.

'Materials for Architects and Builders' covers the broad range of key materials used within the construction industry and is a descriptive introduction to the manufacture, key physical properties, specification and uses of the major building materials. This new edition has been completely revised and updated to include the latest developments in materials technology, in particular the need to adapt for the ecological impact of different materials. The book is illustrated in colour throughout with many photographs and diagrams showing materials and building components both individually and in use. Each chapter lists the up-to-date British and European Standards, revised Building Regulations together with related Building Research Establishment publications and suggested further reading. • Essential reading for students of building, architecture and construction • Extensive coverage all types of building materials • Updated to include latest national and international standards and regulations

This new edition of the handbook of Quay Walls provides the reader with essential knowledge for the planning, design, execution and maintenance of quay walls, as well as general information about historical developments and lessons learned from the observation of ports in various countries. Technical chapters are followed by a detailed calculation

This expansive volume presents the essential topics related to construction materials composition and their practical application in structures and civil installations. The book's diverse slate of expert authors assemble invaluable case examples and performance data on the most important groups of materials used in construction, highlighting aspects such as nomenclature, the properties, the manufacturing processes, the selection criteria, the products/applications, the life cycle and recyclability, and the normalization. Civil Engineering Materials: Science, Processing, and Design is ideal for practicing architects; civil, construction, and structural engineers, and serves as a comprehensive reference for students of these disciplines. This book also: • Provides a substantial and detailed overview of traditional materials used in structures and civil infrastructure • Discusses properties of natural and synthetic materials in construction and materials' manufacturing processes • Addresses topics important to professionals working with structural materials, such as corrosion, nanomaterials, materials life cycle, not often covered outside of journal literature • Diverse author team presents expert perspective from civil engineering, construction, and architecture • Features a detailed glossary of terms and over 400 illustrations

Detail Practice: Building with Steel is a handbook for quick, goal-oriented reading and implementation. Case study projects exemplify common norm details using large-scale drawings. The fundamentals of planning load-bearing structures provide design and planning help. This is supplemented by explanations of common load-bearing structures using examples of residential, office, hall and industrial buildings. Issues of fire safety and building physics particularly relevant to steel construction are treated alongside the use of steel as a material for cladding facades.

Integrating very interesting results from the most important R & D project ever made in Germany, this book offers a basic understanding of tribological systems and the latest developments in reduction of wear and energy consumption by tribological measures. This ready reference and handbook provides an analysis of the most important tribosystems using modern test equipment in laboratories and test fields, the latest results in material selection and wear protection by special coatings and surface engineering, as well as with lubrication and lubricants. This result is a quick introduction for mechanical engineers and laboratory technicians who have to monitor and evaluate lubricants, as well as for plant maintenance personnel, engineers and chemists in the automotive and transportation industries and in all fields of mechanical manufacturing industries, researchers in the field of mechanical engineering, chemistry and material sciences.

For over forty years, Materials for Engineers and Technicians has given thousands of students an easily accessible introduction to materials engineering and manufacturing processes. This renowned text is a comprehensive overview of the wide-ranging subject area, written in a straightforward, readable style. It is devoid of excessive jargon and mathematical complexity, and retains a practical down-to-earth approach. This expanded edition references specifications for materials and materials testing that have been updated to include European-wide standards of the EU. More applications of materials and case studies have been included. New content discusses the choice of materials and processes in relation to 3D printing and the importance of materials recycling and sustainability. The increased emphasis on the selection of materials reflects this aspect of materials engineering now seen within current vocational and university courses. In addition to meeting the requirements of vocational and undergraduate engineering syllabuses, this text also serves as a valuable desktop reference for professional engineers working in product design who require a quick source of information on materials and manufacturing processes.
