Normative economics studies "what ought to be" such as what the outcome of the economy or public policy ought to be in order to satisfy a certain goal (eg., fairness, social efficiency, etc.). An example of normative economics is designing an environmental policy that treats people of different income levels fairly (again numerous other examples are possible).

experience. Environmental Economics is about the way human decisions affect the quality of the environment.

The experimental method is one commonly applied to issues of environmental economics; this book brings together 63 leading researchers in the area and their latest work exploring the behavioural underpinnings of experimental environmental economics. The essays in this volume will be illuminating for both researchers and practitioners, specifically in relation to questions of environmental policy and how a proposed change in incentives or benefits might affect behaviour and consequently, the likely success of a policy. This book argues that the experimental evidence complements theoretic insights, field data and simulating models to improve our understanding of the underlying assumptions and incentives that drive behavioural responses to policy. Covering topical areas of interest such as tradable permit markets, common property and public goods, regulation and compliance and valuation and preferences, the critical advantage of this volume is that each section concludes with discussion points written by economists who do not use experimental methods.

the dynamics of natural systems, and global, with attention paid to issues in both rich and poor nations. In addition to chapters on well-established topics such as the theory and practice of pollution regulation, it includes chapters on new areas of environmental economics research related to common property management regimes; population and poverty; mechanism design; political economy of regulation; experimental evaluations of policy instruments; and technological change.

This 7th edition offers a wealth of new examples and hot topics, such as genetically modified organisms and the cost effectiveness of new transportation fuels. The international edition also considers environmental problems and policies in Western Europe, China and the developing nations.

With contributions from some of globalization's cheer-leaders (David Dollar), its most vocal critics (Joseph E. Stiglitz), and those in between, this collection of essays analyzes globalization's impact on wages and the environment; the degree to which foreign aid helps developing countries; the failures of global governance; immigration; and how foreign investments can wreak havoc on a nation's economy.

Economics is a value laden enterprise--and this despite the oft repeated claims of neutrality, objectivity, and the absence of bias. This volume explores the relationship between Christianity and economics, arguing that the two can and should be integrated. While no single Christian perspective drives the book, the authors do share in common a belief that scholarship shaped by Christian commitments is entirely appropriate and should be an integral part of the professional life of Christian economist. In particular, this volume demonstrates how Christianity shapes the worldview an economist brings to the task, the questions an economist asks, and the policies an economist advocates.

This title was first published in 2003. Over the decades, experiential methods have become an established research tool in environmental economics. Economists working in this area have realised that experimental methods from economics and other disciplines such as psychology and decision theory can be applied to gain insight into the behavioral underpinnings of environmental policy. Economic experiments, in the lab and field, are an attractive tool to address the incentive and contextual questions that arise in environmental policy. Experiments have been and continue to be designed to capture the key elements of market and non-market choices to test theory, for pattern recognition, to testbed new institutions, and to value public goods, including environmental protection. This volume collects the most significant papers in the literature that identify the underpinnings of experimental approaches are complemented by works that specifically address the use of experimental economics to identify choice under risk, conflict, cooperation, environmental policy instruments, and environmental valuation

This book looks in detail at how globalisation has affected activity levels in maritime shipping, aviation, and road and rail freight, and assesses the impact that changes in activity levels have had on the environment.
