Risk management for financial institutions is one of the key topics the financial industry has to deal with. The present volume is a mathematically rigorous text on solvency modeling. Currently, there are many new developments in this area in the financial and insurance industry (Basel III and Solvency II), but none of these developments provides a fully consistent and comprehensive framework for the analysis of solvency questions. Merz and Wüthrich

combine ideas from financial mathematics (no-arbitrage theory, equivalent martingale measure),

actuarial sciences

(insurance claims modeling, cash flow valuation) and

economic theory (risk aversion, probability

distortion) to provide a

fully consistent framework.

Within this framework they

then study solvency

questions in incomplete

markets, analyze hedging

risks, and study asset-and-liability management

questions, as well as issues

like the limited liability

options, dividend to

shareholder questions, the

role of re-insurance, etc.

This work embeds the solvency discussion (and long-term liabilities) into a scientific framework and is intended for researchers as well as practitioners in the financial and actuarial industry, especially those in charge of internal risk management systems. Readers should have a good background in probability theory and statistics, and should be familiar with popular distributions, stochastic processes, martingales, etc.
