Loci. A locus (loci is the plural) is a collection of points which share a property.. E.g. The circumference of a circle is the locus of all points in 2D that are the same distance from a particular point \square the centre. Example: Draw the locus of all the points 1 cm from line AB \square First we set the pair of compasses to 1 cm, and draw a half circle around point A

Method 1. Let $M(x, y)$, $B(x_1, y_1)$ and $C(x_2, y_2)$. Let $y = m(x - 2)$ be the line BC, where m is the slope of the line. Note that this line passes through $A(2, 0)$. Substitute this line into the circle $x^2 + y^2 = 25$ to find the intersection points.

Learning geometry doesn't have to hurt. With a little bit of friendly guidance, it can even be fun! *Geometry For Dummies, 2nd Edition*, helps you make friends with lines, angles, theorems and postulates. It eases you into all the principles and formulas you need to analyze two- and three-dimensional shapes, and it gives you the skills and strategies you need to write geometry proofs. Before you know it, you'll be devouring proofs with relish. You'll find out how a proof's chain of logic works and discover some basic secrets for getting past rough spots. Soon, you'll be proving triangles congruent, calculating circumferences, using formulas, and serving up pi. The non-proof parts of the book contain helpful formulas and tips that you can use anytime you need to shape up your knowledge of shapes. You'll even get a feel for why geometry continues to draw people to careers in art, engineering, carpentry, robotics, physics, and computer animation, among others. You'll discover how to:
