The brain, a gelatinous mass, is invested by a succession of three connective tissue membranes called meninges and is protected by an outer capsule of bone, the skull. The brain floats in cerebrospinal fluid, which supports it and acts as a shock absorber in rapid movements of the head.

The brain is housed inside the bony covering called the cranium. The cranium protects the brain from injury. Together, the cranium and bones that protect the face are called the skull. Between the skull and brain is the meninges, which consist of three layers of tissue that cover and protect the brain and spinal cord.

Today, we're going to talk about the gross anatomy of the nervous system, specifically the central nervous system. The gross anatomy are the things that you can just see with your naked eye. So, the central nervous system consists of the brain and the spinal cord. There are some subdivisions within the brain itself.

The forebrain, the midbrain, and the hindbrain are the three main parts of the brain. The forebrain has two major parts called the diencephalon and the telencephalon. The forebrain is responsible for a number of functions related to thinking, perceiving, and evaluating sensory information. The midbrain, also called the mesencephalon, connects the hindbrain and the forebrain.

The brain's major components are the cerebrum, cerebral hemisphere, brain stem, and cerebellum. The spinal cord is the point of transition between the CNS and the PNS. This is because the nerves of the peripheral nervous system use the spinal cord to communicate directly to the brain in order to control the rest of the body.
