The combined edition of 2009-2010 of the international and interdisciplinary Summer Academy proceedings sheds light on major challenges in the field of energy and the environment: climate

on to study the regional particularities of climate and environmental policy-making, using case studies from Europe, China and Africa.

Finally, the proceedings consider the important part that energy will play in curbing climate change. After all, this sector is the major

contributor of CO2 emissions and therefore the major cause of global warming. Transitional energy sources like gas will be discussed, and the necessary adjustments to our current energy infrastructure will be analyzed in case studies on grids from South America and

This is a book about India's energy shortage, its causes, and consequences. Powerless details how much coal, oil, gas, uranium, and power the country uses, and for what purposes. It examines the quantity of these things the country produces and

where. The book looks at the sizes of the gaps between supply and demand, and how the country fills them with imports. It then discusses how the shortages and resulting imports affect the country's economy, businesses, and residents. After examining the current scenario, the author

moves on to look at predictions for how fast demand and supply will grow, how big the shortages of natural resources might become in the next few years, and whether India is likely to be able—politically, logistically, and financially—to fill these gaps with imports.

The book also looks

at the environmental and health effects of India's growing energy use, and how efforts to mitigate these are likely to affect demand for coal, oil, gas, and uranium.
