Technical Standards. Technical standards pertain to the interoperability and portability of e-learning courses across devices, browsers and platforms. The most commonly used technical standards are SCORM, AICC and WCAG. SCORM stands for Sharable Content Object Reference Model. It is a technical standard developed by the Advanced Distributed Learning Initiative (ADL), and it defines how e-learning courses interact with LMSs to facilitate course tracking.

It could be about making a product, managing a process, delivering a service or supplying materials – standards cover a huge range of activities. Standards are the distilled wisdom of people with expertise in their subject matter and who know the needs of the organizations they represent – people such as manufacturers, sellers, buyers, customers, trade associations, users or regulators.

Development of the International Standards for Tuberculosis Care (ISTC) was supervised by a steering committee whose members were chosen to represent perspectives relevant to tuberculosis care and control. The members of the steering committee and the areas they represent are as follows: • Edith Alarcon (international technical agency, NGO ...

Challenges tradition to show how developments in international relations repeat themselves; we may soon experience a return to past trends.

Biobanking has developed at a rapid pace in recent years, initiated by the drive for personalized medicine and the need for high-quality biological resources, associated data for scientific research, and technological advancement of analytical platforms for molecular and genetic research. This book includes guidelines and recommendations for biobanks not only in high-income countries but also in low- and middle-income countries (LMICs). The recommendations are based on validated and/or evidence-based guidelines. The book also includes sections on sample sharing, ethical, legal, and social issues (ELSI) and harmonization guidelines that are important in supporting the collaborative research efforts that make use of biological materials. In particular, the section on open access deals with the principles of sharing and provides recommendations for biobanks in relation to sample and data sharing, which is key to establishing research collaboration. The section on governance provides guidelines on governance structures and standard templates for biobanks for transparent and effective running of the facilities. This book also benefits from the experience and knowledge gained by IARC from coordinating the LMICs Biobank and Cohort Building Network (BCNet) and managing an international biobank, which contains diverse collections of specimens and data drawn from studies across the world, including the EPIC (European Prospective Investigation into Cancer and Nutrition) collection.

Standardization is no longer a technical activity. Rather, most large firms as well as policymakers and many other public sector entities have realized the economic and political relevance of information and communication technology standards. Accordingly, an increasing number of firms and public authorities experience the need to properly manage their standardization activities. Corporate Standardization Management and Innovation is an essential reference source that discusses various aspects that relate to the management of standardization in private firms and the public sector and identifies good practices in the internal and external management of standardization activities. Focusing around research areas such as digital market, global business, and business strategy, this book is designed to assist academics, practitioners, and researchers in the identification of good practices in management of standardization activities.

While electronic research has developed in many governments around the world, the majority of its research has focused on the supply and demand aspects of e-government instead of the focus on technology integration for successful e-government design. Technology Development and Platform Enhancements for Successful Global E-Government Design compiles the shared experiences of e-government designers and practitioners with a focus on technological design. By highlighting the different technological nuances that need to be incorporated into successful e-government designs, this book is a useful tool for professionals and researchers concerned with the organizational development in different types of e-government communities and environments.

This book analyzes the common set of obstacles to the development and integration of government Information and Communication Technology (ICT) projects and effective e-government initiatives in developing countries. It draws on the expertise and experience of more developed states in the Pacific, notably Australia and New Zealand, both highly rated in global rankings for e-government and active in a variety of e-government development projects across the region. There has been a general failure to identify priorities and align projects with local needs in ICT/e-government projects. Small Island Developing States (or SIDS) present a unique problem in terms of e-government. Not only do they suffer from a common set of barriers to ICT development such as their remoteness, geographical dispersion, moist tropical climates, largely rural populations, and lack of ICT capacity and infrastructure, but are also dependent on external agencies for investment, and must negotiate with powerful donors who have conflicting agendas. E-government is widely regarded as 'transformational', increasing efficiency, productivity, accountability, economic growth, and citizen involvement. But while the governments of SIDS are committed to harnessing ICTs for effective government and economic development, they face major challenges in establishing successful e-government initiatives, due to the problems outlined above, coupled with a lack of HR capacities and appropriate strategies and policies. Drawing on the experience of the states mentioned above, as well as regional quasi-governmental bodies, nongovernmental organizations (NGOs), aid agencies, and the private sector, the book will be of interest to researchers and students in the fields of e-government, public administration, political science, communication, information science, and social media.

This book brings together one hundred and seventy nine selected papers presented at the 2015 International Conference on Design, Manufacturing and Mechatronics (ICDMM2015), which was successfully held in Wuhan, China during April 17-18, 2015. The ICDMM2015 covered a wide range of fundamental studies, technical innovations and industrial applications in advanced design and manufacturing technology, automation and control system, communication system and computer network, signal and image processing, data processing and intelligence system, applied material and material processing technology, power and energy, technology and methods for measure, test, detection and monitoring, applied mechatronics, technology and methods for ship navigation and safety, and other engineering topics. All papers selected here were subjected to a rigorous peer-review process by at least two independent peers. The papers were selected based on innovation, organization, and quality of presentation. The proceedings should be a valuable reference for scientists,

engineers and researchers interested in design, manufacturing and mechatronics, as well as graduate students working on related technologies.

This book explores the main elements of e-Democracy, the term normally used to describe the implementation of democratic government processes by electronic means. It provides insights into the main technological and human issues regarding governance, government, participation, inclusion, empowerment, procurement and, last but not least, ethical and privacy issues. Its main aim is to bridge the gap between technological solutions, their successful implementation, and the fruitful utilization of the main set of e-Services totally or partially delivered by governments or non-government organizations. Today, various parameters actively influence e-Services' success or failure: cultural aspects, organisational issues, bureaucracy and workflows, infrastructure and technology in general, user habits, literacy, capacity or merely interaction design. This includes having a significant population of citizens who are willing and able to adopt and use online services; as well as developing the managerial and technical capability to implement applications that meet citizens' needs. This book helps readers understand the mutual dependencies involved; further, a selection of success stories and failures, duly commented on, enables readers to identify the right approach to innovation in governmental e-Services. With its balanced humanistic and technological approach, the book mainly targets public authorities, decision-makers, stakeholders, solution developers, and graduate students.

E-Government describes the utilization of technologies to improve the lives of citizens and business organizations while facilitating the operation of the government. With the rise of new technologies, governments need to consider implementing Web 2.0 and mobile technologies as a way to offer relevant e-services to citizens so that they may fully participate in governmental affairs. Emerging Mobile and Web 2.0 Technologies for Connected E-Government highlights the latest technologies and how they can be implemented by the government and effectively used by citizens. This book aims to be an inclusive reference source for researchers, practitioners, students, and managers interested in the application of recent technological innovations to develop a more effective e-government system.

"This book examines the stakeholders of e-government and reveals the stages of growth or service maturity levels, shedding light on the paradigms and fundamental discourses of the e-government adoption process"--Provided by publisher.
