This book is the first of a set dedicated to the mathematical tools used in partial differential equations derived from physics. Its focus is on normed or semi-normed vector spaces, including the spaces

of Banach, Fréchet and Hilbert, with new developments on Neumann spaces, but also on extractable spaces. The author presents the main properties of these spaces, which are useful for the

In 1690, Christiaan Huygens (1629-1695) published *Traité de la Lumière*, containing his renowned wave theory of

light. It is considered a landmark in seventeenth-century science, for the way Huygens mathematized the corpuscular nature of light and his probabilistic conception of natural knowledge. This book

discusses the development of Huygens' wave theory, reconstructing the winding road that eventually led to *Traité de la Lumière*. For the first time, the full range of manuscript sources is taken into account. In

addition, the development of Huygens' thinking on the nature of light is put in the context of his optics as a whole, which was dominated by his lifelong pursuit of theoretical and practical dioptrics. In so doing, this

book offers the first account of the development of Huygens' mathematical analysis of lenses and telescopes and its significance for the origin of the wave theory of light. As Huygens applied his

Geometry, this very ancient

Everything is presented clearly and rigourously.

Each property is proved, examples and exercises illustrate the course

content perfectly. Precise hints for most of the
