The scope of
this contributed
volume is to
provide an
overview of the
latest
translational
research in the
field of lupus
pathogenesis,
with particular

Access Free Lupus Volume 4

emphasis on how these discoveries progress in parallel with therapeutic drug development. Systemic lupus erythematosus (SLE) is a multifaceted disease with a number of well-defined immune

Access Free Lupus Volume 4

pathways that are dysregulated, resulting in an immune-mediated chronic inflammatory injury at target organs. As knowledge of these pathways evolves to provide opportunities

Access Free Lupus Volume 4

for targeted drug therapy and lays the foundation for personalized medicine, clinicians and researchers need to keep up with the ever-expanding medical literature. This book will

Access Free Lupus Volume 4

critically
appraise the
current
understanding of
important
immunological
pathways that
contribute to
the pathogenesis
of lupus. We
will review the
role of
interferons as
part of the

Access Free Lupus Volume 4

innate immune defects that perpetuate the loss of self-tolerance in SLE. B cell hyperactivity, as a defining hallmark of SLE, and different strategies of B cell targeted therapy will be discussed. The

Access Free Lupus Volume 4

role of co-stimulation or immune checkpoint molecules in activating B and T cells will be reviewed, as well as other cytokines that serve in the amplification loop promoting a more

Intracellular
targets, such as

pathway, or a
variety of
kinases and

transcriptional
responses that
are important in
SLE. Immune
homeostasis can
also be restored
by bolstering
the naturally
occurring anti-
inflammatory
mechanisms.
Glucocorticoid,

Access Free Lupus Volume 4

as a potent natural anti-inflammatory hormone, can mediate its effects by recruiting histone deacetylase that serve to repress gene transcription. Glucocorticoid-induced leucine

Finally, T regulatory cells can be utilized to help restore to immune
