Oehlert's text is suitable for either a service course for non-statistics

for statistics majors.
Unlike most texts for
the one-term
grad/upper level
course on
experimental design,
Oehlert's new book
offers a superb
balance of both
analysis and design,
presenting three
practical themes to
students: • when to

use various designs

- how to analyze the results
- how to

recognize various design options Also, unlike other older texts, the book is fully oriented toward the use of statistical software in analyzing experiments.

took place roughly between 1920 and 1940, a period now referred to as the "Golden Age of Theoretical Biology". The eminent Italian mathematician Vito Volterra played a decisive and widely acknowledged role in these developments. Volterra's interest in the application of

particular, dates back
to the turn of the
century and was
expressed in his
inaugural address at
the University of
Rome for the
academic year
1900/01 (VOLTERRA
1901). Nevertheless,

It was only in the mid-twenties that Volterra entered the field in person, at the instigation of his son in law, Umberto D'Ancona, who had confronted him with the problem of competition among animal species, asking him whether a mathematical treatment was

possible. From that time on, until his death in 1940, Volterra produced a huge output of publications on the subject. Volterra's specific project was to transfer the model and the concepts of classical mechanics to biology, constructing a sort of "rational mechanics" and an

subject was thus to be
