Neuropsychologists have an important role in potentiating the psychosocial adjustment and quality of life of patients through effective diagnosis and rehabilitation of cognitive and psychomotor deficits caused by acute and chronic disease. Thoroughly updated and expanded, this second edition of the highly acclaimed Medical Neuropsychology contains a complete review of the rapidly developing literature pertaining to the association between cognition and medical diseases. As a compendium of the empirical literature documenting the neuropsychological sequelae of organ and system pathology, this volume will be of interest of all practitioners interested in the integration of neuropsychology into the mainstream of health service delivery.

Greatly revised, the Second Edition presents an extended survey of this rapidly growing field. The book reviews the effects of industrial and pharmaceutical chemicals on human behavior, cognitive function, and emotional status. Features include two new chapters addressing key forensic issues and recent views on multiple chemical sensitivity, sick building syndrome, and psychosomatic disorders; current data on NIOSH and OSHA exposure levels for industrial toxins; and enhanced coverage of testing methods; studies of PET, SPECT, and BEAM imaging applied to neurotoxic exposure.

This volume serves as an aid in the process of differential diagnosis which frequently confronts neuropsychologists. The guide is a compendium of information of the base rates of symptoms across a variety of disorders which neuropsychologists encounter. In addition to serving as a convenient source of information on symptom base rates, this volume also contains detailed cross referencing of symptoms across disorders. It is intended for use by clinical neuropsychologists and psychologists.

No other book reviews clinical neuropsychological assessment from an empirical psychometric perspective. In this completely revised and updated 2nd edition, the concepts and methods of psychometric neuropsychology are presented as a framework by which to evaluate current instruments. Newer methodologies and statistical techniques are discussed, such as meta analysis, effect size, confirming factor analysis and ecological validity. The explosion of research in this area since the publication of the first edition in 1989, has been incorporated, including a greatly expanded chapter on child assessment instruments. This volume is a must for the bookshelf of every clinical neuropsychologist as well as researchers and students. Anyone conducting forensic evaluations will especially find useful the information on reliability and validity when preparing for court appearances.

This ambitious and important second edition of the Handbook of Medical Neuropsychology takes an in-depth approach to the medical conditions and methods of neurorehabilitation. Comprehensive in scope and highly detailed in its coverage, the second edition, like the first, characterizes the effects of disease and the impact of interventions in the current state of advanced medicine at a level appropriate both for researchers and for clinicians. Featuring the most up-to-date information and quantitative research on cognitive neuroscience of autism, HIV/AIDS, cancer, head injury, respiratory diseases, endocrine diseases, early birth injury, dementia, and other disorders, the book handles theory, historical background, practical considerations, and controversial areas with evidence based disease indicators, clinical expertise, and real-world insight. It seeks to critique diagnostic and assessment tools specific to disorders. The new chapters in this inclusive second edition reflect the changes in prominent problems found in the clinic and provide worthy insights for research investigation in their review of: Substance use disorders. Nutrition in neurocognition and mental health. Hypothyroidism and Hashimoto's thyroiditis. Traumatic brain injury in very early childhood. Cognitive functioning in asthma. The role of mindfulness in neurorehabilitation. The Handbook of Medical Neuropsychology, 2nd Edition continues to be an essential resource for the neuropsychology clinician, researcher, practitioner or graduate student. It will be stimulating and relevant reading for years to come.

The most comprehensive, authoritative reference of its kind, this acclaimed work examines a wide range of acquired, congenital, and developmental brain disorders and their impact on children's neuropsychological functioning. Leading experts present state-of-the-art knowledge about how each condition affects the developing brain; the nature and severity of associated cognitive, behavioral, and psychosocial impairments; and effective approaches to clinical evaluation and treatment planning. New to This Edition *Reflects significant scientific advances. *An additional coeditor, Bruce F. Pennington. *Chapters on math, reading, and language disabilities; attention-deficit/hyperactivity disorder; autism; and intellectual disabilities. *Medical disorders not covered in prior edition: acute disseminated encephalomyelitis and multiple sclerosis; tuberculous sclerosis; childhood stroke; and fetal alcohol syndrome. *A chapter on evidence-based neuropsychological interventions.

When Handbook of Normative Data for Neuropsychological Assessment was published in 1999, it was the first book to provide neuropsychologists with summaries and critiques of normative data for neuropsychological tests. The Second Edition, which has been revised and updated throughout, presents data for 26 commonly used neuropsychological tests, including: Trailmaking, Color Trails, Stroop Color Word Interference, Auditory Consonant Trigrams, Paced Auditory Serial Addition, Ruff 2 and 7, Digital Vigilance, Boston Naming, Verbal Fluency, Rey-Osterrieth Complex Figure, Hooper Visual Fluency, Design Fluency, Tactual Performance, Wechsler Memory Scale-Revised, Rey Auditory-Verbal Learning, Hopkins Verbal Learning, WHO/UCLA Auditory Verbal Learning, Benton Visual Retention, Finger Tapping, Grip Strength (Dynamometer), Grooved Pegboard, Category, and Wisconsin Card Sorting tests. In addition, California Verbal learning (CVLT and CVLT-II), CERAD ListLearning, and selective Reminding Tests, as well as the newest version of the Wechsler Memory Scale (WMS-III and WMS-III-A), are reviewed. Locator tables throughout the book guide the reader to the sets of normative data that are best suited to each individual case, depending on the demographic characteristics of the patient, and highlight the advantages associated with using data for comparative purposes. Those using the book have the option of reading the authors' critical review of the normative data for a particular test, or simply turning to the appropriate data locator table for a quick reference to the relevant data tables in the Appendices. The Second Edition includes reviews of 15 new tests. The way the data are presented has been changed to make the book easier to use. Meta-analytic tables of predicted values for different ages (and education, where relevant) are included for nine tests that have a sufficient number of homogeneous datasets. No other reference offers such an effective framework for the critical evaluation of normative data for neuropsychological tests. Like the first edition, the new edition will be welcomed by practitioners, researchers, teachers, and graduate students as a unique and valuable contribution to the practice of neuropsychology.

Historically, relatively few investigations in neuropsychology have been sensitive to the analysis of cultural variables. This handbook will assist the neuropsychologist interested in cultural competence and help increase understanding of the link between cultural competence in assessment and intervention and good treatment outcomes. The handbook authors provide an in-depth discussion of the current status of multicultural training in neuropsychology; specific information on diverse groups (age, gender, ethnicity, etc.), assessment instruments, and clinical populations (HIV infected, seizure disorders, brain injuries); and unique analysis of immigration patterns, forensics, and psychopharmacology. This volume is the first to summarize the cultural data available in neuropsychology. A valuable resource for clinical neuropsychologists, school psychologists and rehabilitation professionals.

The inter-comparison of specific skills as represented by performance on neu- psychological tests is at the heart of the neuropsychological assessment process. However, there is a tendency to regard the interpretation of single tests as a process that is independent of performance on other tests, with integration of test information representing a summary of these individual test performances. As neuropsychology has become increasingly sophisticated, it has been recognized that many factors influence the performance on any given test. The meaning of the same score may vary considerably from one person to another, depending on his or her performance on other neuropsychological tests. Thus, a low score on the Halstead Category Test may indeed reflect frontal lobe damage, but only if we first rule out the influence of visual-spatial problems, emotionality, attentional issues, motivation, fatigue, and comprehension of the instructions. Simplistic interpe- tions that assume a common interpretation based on a specific score will inva- bly lead to errors in interpretation and conclusions. The purpose of this book is to provide each test that is described with a compendium of the possible interpretations that can be used with a variety of common tests that are often included in a neuropsychological test battery. The first chapter discusses some of the pitfalls and cautions when comparing the tests, while the second chapter examines administrative and scoring issues that may be unclear or unavailable for a given test.

The growth of clinical neuropsychology has been unprecedented. This growth has been oriented more toward the provision of than toward the foundation for services. Thus, while a greater number of psychologists are performing a greater number of neuropsychological procedures, there seems to us an uneven parallel growth between these services and the empirical foundations for them. It should come to no one's surprise that increasingly aggressive attacks on the field have been leveled. Despite these attacks, clinical neuropsychology continues to enjoy exceptional growth within psychology and acceptance by other health practitioners, insurance companies, legislators, judges, juries, and above all, consumers of our services. Growth without self-reflection is a dangerous enterprise, as is growth without directions. We find it disconcerting that existing and limited "self analysis" has assumed that neuropsychological dysfunction is immune to the same variables that affect psychological dysfunction. Some attention has been paid to the most obvious ones, such as age, but all others have been ignored and/ or misunderstood. This neglect has spawned a body of knowledge replete with questionable data and unfounded conclusions. Hence, it is surprising that clinical neuropsychologists consider themselves to be more scientifically sound than their regular clinical counterparts.
