In this book international experts discuss the state-of-the-art in the biological degradation of hydrocarbons to meet remedial or disposal goals. The work focuses on practical applications, often on globally important scales including the remediation of some of the world's largest crude oil spills. Other related chapters discuss important implications of microbial transformation of hydrocarbons, including treatment of high fat processing wastes, impacts of microbial biodegradation activity on industrial processes, and the implications of microbial oil degradation in relation to modern oil extraction processes like hydraulic fracturing of shales and extraction of oil sands.

Because water access, distribution and quality are the most urgent challenges for societies across the world, this book focuses on the current and future demands and challenges in the areas of water scarcity we may face and possible solutions in terms of technology and management including infrastructure changes that are needed for the future smart cities. Readers of this book shall gain an increased understanding of water supply and its demands and shall learn some of the research trends to overcome global water scarcity and urban growth by creating smart cities.

The intent of this book is to provide a detailed and specific set of guidelines for both aquapreneurs and researchers related to the application of Biofloc Technology in aquaculture. This book discusses key issues related to both adoption and practices for aquaculture businesses, how to monitor and assess quality and quantity of biofloc, and how to manage the microbial composition and sludge reduction risk in the fish and shrimp culture. The book works through the specific application of disease management and feed management tools for aquaculture from the perspective of this technology. Particular attention is paid on comparing the prototypes of floc development and evaluation on its efficacy in aquaculture. Note: T&F does not sell or distribute the hardback in India, Pakistan, Nepal, Bhutan, Bangladesh and Sri Lanka.

Covering the latest developments in themes related to water disinfection by-products, this book brings the reader right up to

date. Stemming from an international conference, contributions are from decision-makers, regulators and the relevant scientific community. Coverage includes emerging disinfection by-products, water treatment, water recycling, monitoring, regulation and health and toxicology aspects. It will be of interest to water companies, public health professionals, drinking water quality regulators, suppliers of laboratory and on-line monitoring equipment, analytical chemists, and academic and industry researchers working in the area of disinfection by-products.

This book describes the structural features and properties of important types of hydrocarbons and lipids and gives an overview of their analytical characterization in biological and environmental matrices. It covers the occurrence, biosynthesis and biological functions of these compound types in diverse organisms including bacteria and archaea, algae, higher plants and arthropods. It examines their distribution in the geosphere and fundamental processes controlling the fate of fossil organic matter. Finally, it addresses important aspects of their environmental chemistry and transfer processes between different compartments of bio- and geosphere. Hydrocarbons and lipids comprise extremely diverse organic compounds that play fundamental roles in biosphere and geosphere. They represent important functional components in all living organisms and constitute a major fraction of fossil organic matter in sedimentary systems. All chapters are written by renowned experts in the respective fields.

This authoritative review will be valuable reference for marine biologists, ecologists, and taxonomists. It is also an essential handbook for the penaeid fisheries biologist or aquaculturist and is a prerequisite for the rational exploitation and cultivation of penaeids. Although penaeids are a large and diverse decapod group which have been exploited commercially in both fisheries and aquaculture for hundreds of years, no comprehensive review of their biology has never been written. The group's commercial importance has led to an unbalanced literature, dominated by the fisheries and aquaculture aspects of the genus *Penaeus*, often without an appreciation of their underlying biology. This review adopts a multidisciplinary approach to give a comprehensive and up-to-date account of morphology, taxonomy (including larvae), zoogeography, physiology, reproduction, feeding, growth, behaviour, and life histories. Chapters discussing the parasites of, and predation on penaeids, are also included. So much new material is presented that the book is more than just a review of the existing literature. In synthesising the published information across this diverse family, it puts the commercially important species and genera into a larger perspective, pointing to deficiencies in our understanding and creating a framework for areas of future research.

"This book describes the biochemistry and genetics of aerobic

degradation of hydrocarbons and lipids by bacteria and yeasts, as well as the functional genomics of the best-known microorganisms involved in these processes. It forms part of the Handbook of Hydrocarbon and Lipid Microbiology Series, a definitive resource of current knowledge on the diverse aspects of the interactions of microbes with hydrocarbons and lipids. Chapters are mainly focused on the new discoveries of recent years. It is aimed to scientists and others interested in different aspects of the microbiology of hydrocarbons."--Publisher's website.

A textbook and resource for professional scientists working in the areas of industrial microbiology, environmental microbiology, and biodegradation. - Details both the fundamental concepts of the microbial transformation of organic compounds as well as its application for biotechnology and biodegradation. - Offers comprehensive coverage of microbial catabolism from the group that developed the online Biocatalysis/Biodegradation Database (<http://umbbd.msi.umn.edu/>). - Discusses the logic of catabolism, which is important in the context of genome annotation and predicting biodegradation reactions.

Contamination of the environment is of enormous economic and environmental significance. This book reviews the latest research on the harnessing of biotechnology to decontaminate the environment. Internationally acclaimed authors from diverse fields present comprehensive reviews of the most important and well-established solutions to environmental contamination. The limitations as well as the future potential of these practices are critically highlighted. The book also includes stimulating reviews of selected practices which are either novel or the subject of some debate in bioremediation research and practice. This is essential reading for bioremediation researchers and practitioners who wish to look beyond current practice and explore new avenues that may ultimately change the way in which bioremediation is conducted, monitored and studied.

Aquaculture Health Management: Design and Operation Approaches is an essential reference for the diverse aquaculture community. With the steadily increasing importance of healthy fish production and the expansion of the animal aquaculture industry to new geographic areas, new microbial and parasitic species with pathogenic potential continue to emerge. The book covers the broad spectrum of fish and shellfish health, the functional roles of pathogen emergence, and the impacts of nutrition and preventative medicine such as pre- and probiotics, as well as chemical treatments, relevant legislation and more. This reference takes a comprehensive approach to understanding overall fish health management, making it valuable to aquaculturists, practitioners in aquatic animal health, veterinarians and all those in industry, government or academia who are interested in aquaculture and fisheries and their sustainable futures. Presents the biosecurity measures used to prevent the spread of disease Discusses fish immunology to help
