Tanzania, the land and the people have been subject of a great deal of historical research, but there remains no readily accessible and concise history of the country. The aim of this volume is to fill that void. A New History of Tanzania takes its name from a lecture series introduced at the University of Dar es Salaam by Professor Isaria Kimambo in 2002. Prior to that, a book titled, A History of Tanzania, had been published in 1969 by East African Publishing House in Nairobi for the Tanzania Historical Association. That book is currently out of print and this is not a reprint. In this book, Prof. Kimambo has been joined by two other colleagues; Prof. Gregory H. Maddox of Texas Southern University, Houston (USA) and Salvatory S. Nyanto, a Tanzanian, Lecturer at the University of Dar es Salaam, and a Ph.D. candidate at the University of Iowa (USA); together they have produced an outline history of Tanzania that covers all important aspects from antiquity to the present that is different from and richer than its predecessor. Sources from the fields of archaeology, anthropology, biology, genetics and oral tradition have been used to produce this excellent book. A New History of Tanzania is a timely contribution to academic requirements for teaching and learning Tanzania's history. It is also a possible exemplar to the writing of other countries' histories, departing as it does, from the traditional historiography that is influenced by colonial and postcolonial apologists of nefarious external influences on Africa's history. It will also interest other Tanzanians and visitors to Tanzania who are interested in understanding the country from when it was a territory with more than one hundred and twenty ethnic groups, to a nation with an unmistakable identity as it marches forward.

Functional advanced biopolymers have received far less attention than renewable biomass (cellulose, rubber, etc.) used for energy production. Among the most advanced biopolymers known is chitosan. The term chitosan refers to a family of polysaccharides obtained by partial de-N-acetylation from chitin, one of the most abundant renewable resources in the biosphere. Chitosan has been firmly established as having unique material properties as well as biological activities. Either in its native form or as a chemical derivative, chitosan is amenable to being processed—typically under mild conditions—into soft materials such as hydrogels, colloidal nanoparticles, or nanofibers. Given its multiple biological properties, including biodegradability, antimicrobial effects, gene transfectability, and metal adsorption—to name but a few—chitosan is regarded as a widely versatile building block in various sectors (e.g., agriculture, food, cosmetics, pharmacy) and for various applications (medical devices, metal adsorption, catalysis, etc.). This Special Issue presents an updated account addressing some of the major applications, including also chemical and enzymatic modifications of oligos and polymers. A better understanding of the properties that underpin the use of chitin and chitosan in different fields is key for boosting their more extensive industrial utilization, as well as to aid regulatory agencies in establishing specifications, guidelines, and standards for the different types of products and

applications.
