allergenicity and health. The volume provides a technical explanation of the bioactive nutrients and dietary benefits of the peanut. It also reviews and analyzes the evidence implicating peanuts as a food allergen. Moving beyond nutritional science to food technology and engineering, the book demonstrates how genetic, pre-harvest, post-harvest and processing technologies can be applied to increase the nutraceutical value of peanuts and mitigate their risks.

Groundnuts (peanuts) are of great economic importance internationally. This book provides thorough coverage of all

aspects of the crop, each chapter being written by experts in particular areas. The book will be invaluable to all those involved with the group, particularly agronomists, plant scientists and food scientists.

Seeds provide more than half of the world's intake of dietary protein and energy and thus are of immense economic, cultural and nutritional importance. Proteins can account for up to 40% of the dry weight of various types of seeds, thereby making a large contribution to the nutritional quality and processing properties of seeds. It is, therefore, not surprising that seed proteins were among the first plant components to be

Systematically studied, some 250 years ago, and have been a major focus of research over the past 100 years. The properties and behaviour of seed proteins pervade modern life in numerous ways. For example, legume and cereal proteins are used in the production of a wide range of meat-free foods; the process of bread-making is dependent on the physical chemical properties of wheat seed proteins; and in developed, as well as developing, countries, nutritional deficiencies among vegetarian diets are avoided through balancing legume and cereal seeds as sources of dietary proteins. Understanding seed proteins, in order to improve their composition and properties and

to increase their concentrations, will thus continue to be an important research objective for the future. The present volume represents the culmination of a long-discussed plan of the editors, to bring together the best international authorities in order to compile a definitive monograph on biological, biochemical, molecular and genetic aspects of seed proteins.

This book explores the recent advances and integrations in molecular technology in food research platforms, which have revolutionized the way we discover and trace potential allergens in our food and drugs

and how we utilize that for diagnosis and management. These different technologies for global allergenomic profiling in different kinds of food are discussed, including mass spectrometry, chromatography, and nuclear magnetic resonance. The book also addresses multiomics research with bioinformatics strategies in food allergy in terms of allergen characterization and quantitation, and covers applications in food allergy research from discovery to routine analysis.
