In medical practice there are often complex cases that make extraordinary demands on a clinician's knowledge and ingenuity. In Challenging Cases in Allergy

and Immunology, the authors provide these types of fascinating, and informative cases to complement a basic knowledge of diagnosis and management in these fields. As such, this novel title will be of interest to a wide array of allergists and clinical immunologists, as well as all students of medicine and allied health. Written by a multidisciplinary group of national and international experts, the book covers in detail two or more challenging, real-life cases in each disorder discussed. Each case is followed by a work-up, treatment plan, and discussion that includes a

differential diagnosis, up-to-date references, and up to ten thought-provoking, multiple-choice questions that enhance the book's value as a comprehensive reference and teaching text. The cases include not only the common allergic diseases such as allergic rhinitis, asthma, and food allergy, but also disorders in immune regulation, autoimmunity, and immunodeficiencies. There are chapters on subjects as wide-ranging as anaphylaxis, occupational asthma, and immune-mediated rheumatic diseases. State-of-the-art and evidence-based, Challenging Cases in Allergy and Immunology is an

International Congress of Autoimmunity has become established as one of the major meetings in the field of immunology, with presentations covering every aspect of basic research in the hopes of clarifying pathogenesis of autoimmune disease as well as providing information on the latest innovations in biological and other modes of treatment. The goal of this volume is to present cutting edge research that focuses in particular on newer diagnostic tools and newer therapies for human autoimmune disease. The incidence of autoimmune diseases is increasing worldwide, and the search

for better management of these diseases and even for a cure is being pursued by scientists from many disciplines. Tools from the areas of genetics, neuroscience, cell biology, virology, and infectious disease are being applied to the problem and are yielding useful results. This volume contains the first section of the proceedings of a large, comprehensive meeting held in Sorrento, Italy. Because the meeting focused on such an important area of human health, four volumes have been dedicated to it: Part A presents new principles in autoimmunity, including the roles of key

players such as designed ankyrin repeat proteins, SLAM-associated protein, interleukin-12, human proteinase 3, the complement system, IgG, disturbances in cytokine synthesis, and IFN- γ blockers. The second section of the volume takes a look at new diagnostic tools, including screening of endothelial expression libraries, electrical skin impedance, and IgA anti-tissue transglutaminase antibody assays.

Autoimmunity, Part B continues the presentation of basic research and its applications with a focus on genetics. Parts C and D present the clinical

research in various manifestations of autoimmune disease and its treatments.

THE authoritative guide for clinical laboratory immunology For over 40 years the Manual of Molecular and Clinical Laboratory Immunology has served as the premier guide for the clinical immunology laboratory. From basic serology testing to the present wide range of molecular analyses, the Manual has reflected the exponential growth in the field of immunology over the past decades. This eighth edition reflects the latest advances and developments in the diagnosis and treatment of patients with infectious

and immune-mediated disorders. The Manual features detailed descriptions of general and specific methodologies, placing special focus on the interpretation of laboratory findings, and covers the immunology of infectious diseases, including specific pathogens, as well as the full range of autoimmune and immunodeficiency diseases, cancer, and transplantation. Written to guide the laboratory director, the Manual will also appeal to other laboratory scientists, especially those working in clinical immunology laboratories, and pathologists. It is also a

useful reference for physicians, mid-level providers, medical students, and allied health students with an interest in the role that immunology plays in the clinical laboratory.

This book addresses hot issues in the research and management of difficult-to-treat medical disorders that are commonly encountered, but for which the underlying mechanisms are often unknown. These include the adverse effects of hemodialysis and its biocompatibility in chronic kidney insufficiency, particularly related to malnutrition and

inflammation, or the vulnerability of cancer patients to bacterial meningitis, the infection that remains underdiagnosed due to limited expression of symptoms. The book also covers other key topics, such as the psychological care of lung cancer patients; difficulties in the diagnosis of diffuse axonal injury in traumatic brain injury - a disorder with a poor prognosis and high mortality rate; and the virological aspects of seasonal influenza epidemic outbreaks - a perennial modern scourge. Further, it addresses recent developments in targeted

drug delivery from titanium implants and a novel integrated thermal approach to rehabilitation of neurodegeneration-related disabilities. Featuring the latest interdisciplinary trends in biomedicine, this book connects research, theory and practice to help alleviate suffering caused by a variety of diseases. It is a resource for medical professionals, including academics, practitioners and all allied healthcare workers.

This book, based on a recent German publication, offers an overview of basic data and recent developments in

the groundbreaking field of molecular allergology. It comprehensively explores the origin and structure of single allergen molecules ("components") and their utility in improving the management of type I, IgE-mediated allergic reactions and disorders like allergic respiratory diseases, food allergies, and anaphylaxis. Highly specific testing, called component-resolved diagnostics, aims to identify and utilize single molecules. Over 200 single allergens from plant or animal sources have been applied to single or multiplex laboratory testing for the presence of allergen-

specific IgE. This leap in assay sensitivity and specificity has led to three major advances in patient management: discrimination between primary allergic sensitization and complex cross-reactivity, recognition of IgE profiles for certain allergens and identification of patients most likely to benefit from allergen-specific immunotherapy. The book discusses in detail the benefits and limitations of this 21st century technology, and offers suggestions for the use of molecular allergology in routine clinical practice. It is a “must read” for

physicians treating allergic patients as well as scientists interested in natural allergic molecules and their interactions with the human immune system.
