Where is U.S. secondary-level science education heading today? That's the question that The Essentials of Science, Grades 7-12 sets out to answer. Over the last century, U.S. science classes have consistently relied on lectures, textbooks, rote memorization, and lab demonstrations. But with the onset of NCLB-mandated science testing and increased concern over the United States' diminishing global stature in science and technology, public pressure is mounting to educate students for a deeper conceptual understanding of science. Through lively examples of classroom practice, interviews with award-winning science teachers and science education experts, and a wide-ranging look at research, readers will learn * How to make use of research within the cognitive sciences to foster critical thinking and deeper understanding. * Innovative, engaging ideas for implementing scientific inquiry in the classroom. * Holistic strategies to address the complex problems of the achievement gap, equity, and resources in the science classroom. * Strategies for dealing with both day-to-day and NCLB assessments. * How professional learning communities and mentoring can help teachers reexamine and improve their practice. Today's secondary science teachers are faced with an often-overwhelming array of challenges. The Essentials of Science, Grades 7-12 can help educators negotiate these challenges while making their careers more productive and rewarding.

One of the central features in current educational reforms is a focus on learning outcomes. Many countries have established or revised standards to describe what teachers are supposed to teach and students are expected to learn. More recently, the emphasis has shifted to considerations of how standards can be operationalized in order to make the outcomes of educational efforts more tangible. This book is the result of a symposium held in Kiel, that was arranged by two science education groups, one at the IPN (Leibniz-Institute for Science and Mathematics Education at the University of Kiel) in Germany and the other at the University of York, UK. The seminar brought together renowned experts from 12 countries with different notions of the nature and quality of learning outcomes. The aim was to clarify central conceptions and approaches for a better understanding among the international science education community. The book is divided into five parts. In Part A, the organizers set the scene, describing the rationale for arranging the symposium. Part B provides a broad overview about different approaches, challenges, and pitfalls on the road to the clarification of meaningful and fruitful learning outcomes. The set of papers in Part C provides deep insights into different, although comparable approaches which aim to frame, to assess, and to promote learning and learning outcomes in science education. Smaller projects are presented as well as broad, coordinated national programs. The papers in Part D outline the individual historical development from different national perspectives, reflecting the deficits and problems that led to current reforms. Finally, a summary of the organizers analyses the conclusions from different vantage points.
