Over the past 20 years, software architectures have significantly contributed to the development of complex and distributed systems. Nowadays, it is recognized that one of the critical problems in the design and development of any complex software system is its architecture, i.e. the organization of its architectural elements. Software Architecture presents the software architecture paradigms based on objects, components, services and models, as well as the various architectural techniques and methods, the analysis of architectural qualities, models of representation of architectural templates and styles, their formalization, validation and testing and finally the engineering approach in which these consistent and autonomous elements can be tackled.

In this book Floyd Gray explores how the treatment of controversial subjects in French Renaissance writing was affected both by rhetorical conventions and by the commercial requirements of an expanding publishing industry. Focusing on a wide range of discourses on gender issues - misogynist, feminist, autobiographical, homosexual and medical - Gray reveals the extent to which these marginalized texts reflect literary concerns rather than social reality. He then moves from a close analysis of the rhetorical factor in the Querelle des femmes to consider ways in which writing, as a textual phenomenon, inscribes its own, sometimes ambiguous, meaning. Gray offers richly detailed readings of writing by Rabelais, Jean Flore, Montaigne, Louise Labé, Pernette du Guillet and Marie de Gournay among others, challenging the inherent anachronism of those forms of criticism that fail to take account of the rhetorical and cultural conditions of the period.
