Kirk and Miller define what is -- and what is not -- qualitative research. They suggest that the use of numbers in the process of recording and analyzing observations is less important than that the research should involve sustained interaction with the people being studied, in their own language and on their own turf. Following a chapter on objectivity, the authors discuss the role of reliability and validity and the problems that arise when these issues are neglected. They present a paradigm for the qualitative research process that makes it possible to pursue validity without neglecting reliability.

"This book teaches the reader not only how to conduct a first research project, but also how to construct an argument, a theory, and critically explore a belief. This Fast Facts book has been written with the novice researcher in mind. It presents an easy guide through the steps needed to be taken when embarking on a research project. It is not a research textbook that intends to cover all aspects of the research study, nor does it teach the reader how to do statistical analysis. For many novice researchers, hiring a statistician, or using the institutional statistician will be needed. This user friendly "pocket support book" can help take the fear out of engaging in research, improve problem solving, and increase the readers interest-dare I say, love?-of research!"--

The authors present an elementary and exceptionally lucid introduction to issues in measurement theory. They define and discuss validity and reliability; proceed to a discussion of three basic types of validity, including criterion, content, and construct validity; present an introductory discussion of classical test theory, with an emphasis on parallel measures; and present a clear discussion of four methods of reliability estimation, including the test-retest, alternative form, split-half, and internal consistency methods of reliability assessment. The text is concluded with a discussion of the use of reliability assessment for purposes of correcting bivariate correlations for attenuation due to random measurement error.

Doing Management Research, a major new textbook, provides answers to questions and problems which researchers invariably encounter when embarking on management research, be it quantitative or qualitative. This book will carefully guide the reader through the research process from beginning to end. An excellent tool for academics and students, it enables the reader to acquire and build upon empirical evidence, and to decide what tools to use to understand and describe what is being observed, and then, which methods of analysis to adopt.
