There is a paradigm shift in plastic and reconstructive surgery from the interest of developing new surgical techniques into the application of new technologies via research based studies on stem cells, tissue engineering and new field of reconstructive transplantation such as e.g. face, hand or larynx transplants. This approach is relatively novel and introduced to plastic surgery within past decade. Thus there is an urgent need to facilitate access to this new knowledge which was not traditionally a part of plastic surgery curriculum. The most efficient way of introducing these new approaches is via presentation of pertinent to different fields (stem cell, transplantation, nerve regeneration, tissue engineering) experimental models which can be used as a tool to develop technologies of interest by different groups of surgeons. These surgical specialities which will be interested and benefit from the book include: plastic and reconstructive surgeons, microsurgeons, hand surgeons, orthopaedic surgeons, neurosurgeons and transplant surgeons.

Furthermore, it addresses topics such as rehabilitation and scar management in detail. It provides comprehensive reconstruction guidelines organized by anatomic region (e.g. face, hands, ...) as well as future trends and prospects in burn reconstruction, such as allotransplantation and bionics. Please also have a look at the volume "Handbook of Burns Volume 1 - Acute Burn Care 2nd edition"

This extensively revised second edition describes how techniques previously developed by Dr. Rollin Daniel for use in open rhinoplasty can be adapted for the closed approach. The author argues that this offers greater feedback during surgery, a shorter recovery period and absence of scarring. The book includes a full explanation of preoperative preparation, including evaluation of the nasal surface aesthetics using the concept of geometric polygons as aesthetic subunits to define both the existing deformity and the aesthetic goals. Aided by a wealth of color photos, it also provides step-by-step descriptions of the surgical techniques developed and modified to achieve the desired surface appearance, and illustrates how the novel dissection and redrape control methods reduce the healing time and enhance outcomes. Further, the book presents a series of case analyses documenting the benefits of the approach. Written in a "cookbook style" this superbly illustrated book enables plastic surgeons to quickly learn how to utilize the closed approach to rhinoplasty for optimal aesthetic benefit.

This book is written as a guide for patients suffering from lipedema. Known as a common, painful fat distribution disorder characterised by a disproportional fat accumulation, lipedema represents an unmet medical need where scientific evidence on both pathophysiology and its treatment is still lacking. As the number of affected patients is increasing, besides striving to map the conundrum of clinical signs and relate these to their underlying mechanisms, developing standardised approaches addressing both fat mass reduction and body contouring are key issues able to warrant therapeutic success. In this book, our intention was to look at this complex disease from all its actual perspectives and provide a concise summary of the actual state of knowledge for all those affected. After looking into the most actual data on the aetiology, pathophysiology and course of the disease, the book then focuses on our complex treatment protocols where recurrent conservative and surgical treatment options are systematically analyzed, considering their long-term chances of success as well as associated risks and side effects. We propose a three step treatment approach. 1st step initiates with weight control and addresses obesity, if present. 2nd step is an individual liposuction therapy plan to treat all lipedema areas, and more. 3rd step includes body contouring surgery, only in patients with massive skin laxity after liposuction and / or massive weight loss.

This book examines distinct innovative and modern techniques for breast reconstruction after a mastectomy necessitated by breast cancer. It serves as not only an entry point in learning about the most modern and promising surgical techniques available, but as a pragmatic guide as well. Beginning with an introduction to the history of the subject, the opening chapter offers a lesson in the evolution of the development and improvement of breast reconstruction techniques. Following this, chapters examine anatomic landmarks, including vascular anatomy, design and markings and best indications depending on the type of breast to be reconstructed. Subsequent chapters then present a multitude of surgery methods, including the progression from large open surgical procedures, to endoscopic approaches, and robotic assisted minimally invasive surgery. Finally, scaffold-based tissue engineering that offers a promising future for breast reconstruction surgeries without donor site morbidity is also reviewed. Additionally, the book's expertly written text is supplemented by high-quality illustrations and videos that provide vital surgical guidance for improved surgical outcomes. Comprised of contributions from world-renowned plastic surgeons, Breast Reconstruction: Modern and Promising Surgical Techniques is an invaluable reference for residents, fellows, practicing and highly experienced plastic surgeons, breast surgeons, and those in surgical sub-specialties.

Breast cancer is a disease requiring multidisciplinary management including surgery, medical and radiation oncology, radiology, pathology, nuclear medicine, genetic counseling, and psychological support. Each member of the team needs to be updated continuously on breast cancer treatment because of its rapidly changing nature. From the diagnostic procedures to operations and even in metastatic stages of breast cancer, surgeons play an essential part in multidisciplinary teams. After standard surgical options, oncoplastic breast surgery is rapidly becoming one of the most important surgical topics that should be learned by attending surgeons. The idea of writing this book stemmed from a collaboration between the European Academy of Senology (EAoS), European Institute of Oncology (IEO), Euro-Asian Society of Mastology (ESOMA), and SENATURK (Turkish Academy of Senology), which have been working together to promote better training in breast care for professionals. The book offers invaluable support for breast surgeons by covering critical and essential information in senology. It will also greatly benefit the other members of multidisciplinary teams, surgery residents, gynecologists, and plastic and reconstructive surgeons.

Aesthetic rhinoplasty is among the most common aesthetic operations in the field of facial aesthetic plastic surgery, but it is also viewed as one of the most complex. Plastic Surgery, A Problem Based Approach provides a problem-based approach to solutions for common scenarios in plastic, reconstructive and aesthetic surgery and serves as a practical guide to managing a plastic surgical case. This book outlines a pathway through management for the clinician, consisting of six phases: 1) Recognition of the condition: facilitated by high quality images. 2) General approach: provided by an opening “ mindset ” statement for the particular case. 3) Assessment: the critical aspects of the history and examination. 4) Treatment: key decisions and key interventions. 5) Management: post-intervention expectations. 6) Evidence: the rationale behind the preceding treatment and an overview of any controversies. Plastic Surgery, A Problem Based Approach is a valuable reference tool for surgical trainees, medical students, healthcare professionals and plastic and reconstructive surgeons.
