Winner of the History of Science Society's Watson Davis and Helen Miles Davis Prize in the History of Science. From the early exploits of Teddy Roosevelt in Africa to blockbuster films such as March of the Penguins, Gregg Mitman's Reel Nature reveals how changing values, scientific developments, and new technologies have come to shape American encounters with wildlife on and off the big screen. Whether crafted to elicit thrills or to educate audiences about the real-life drama of threatened wildlife, nature films then and now have had an enormous impact on how Americans see, think about, consume, and struggle to protect animals across the globe. For more information about the author go to: <http://gmitman.com/>

This may be hard to believe but it is very likely that more people live in closer proximity to more wild animals, birds and trees in the eastern United States today than anywhere on the planet at any time in history. For nature lovers, this should be wonderful news -- unless, perhaps, you are one of more than 4,000 drivers who will hit a deer today, your child's soccer field is carpeted with goose droppings, coyotes are killing your pets, the neighbor's cat has turned your bird feeder into a fast-food outlet, wild turkeys have eaten your newly-planted seed corn, beavers have flooded your driveway, or bears are looting your garbage cans. For 400 years, explorers, traders, and settlers plundered North American wildlife and forests in an escalating rampage that culminated in the late 19th century's "era of extermination." By 1900, populations of many wild animals and birds had been reduced to isolated remnants or threatened with extinction, and worry mounted that we were running out of trees. Then, in the 20th century, an incredible turnaround took place. Conservationists outlawed commercial hunting, created wildlife sanctuaries, transplanted isolated species to restored habitats and imposed regulations on hunters and trappers. Over decades, they slowly nursed many wild populations back to health. But after the Second World War something happened that conservationists hadn't foreseen: sprawl. People moved first into suburbs on urban edges, and then kept moving out across a landscape once occupied by family farms. By 2000, a majority of Americans lived in neither cities nor country but in that vast in-between. Much of sprawl has plenty of trees and its human residents offer up more and better amenities than many wild creatures can find in the wild: plenty of food, water, hiding places, and protection from predators with guns. The result is a mix of people and wildlife that should be an animal-lover's dream-come-true but often turns into a sprawl-dweller's nightmare. Nature Wars offers an eye-opening look at how Americans lost touch with the natural landscape, spending 90 percent of their time indoors where nature arrives via television, films and digital screens in which wild creatures often behave like people or cuddly pets. All the while our well-meaning efforts to protect animals allowed wild populations to burgeon out of control, causing damage costing billions, degrading ecosystems, and touching off disputes that polarized communities, setting neighbor against neighbor. Deeply researched, eloquently written, counterintuitive and often humorous Nature Wars will be the definitive book on how we created this unintended mess.

Environmentalism and ecology are areas of rapid growth in academia and society at large. Screening Nature is the first comprehensive work that groups together the wide range of concerns in the field of cinema and the environment, and what could be termed "posthuman cinema." It comprises key readings that highlight the centrality of nature and nonhuman animals to the cinematic medium, and to the language and institution of film. The book offers a fresh and timely intervention into contemporary film theory through a focus on the nonhuman environment as principal register in many filmic texts. Screening Nature offers an extensive resource for teachers, undergraduate students, and more advanced scholars on the intersections between the natural world and the worlds of film. It emphasizes the cross-cultural and geographically diverse relevance of the topic of cinema ecology.

It may be surprising to us now, but the taxidermists who filled the museums, zoos, and aquaria of the twentieth century were also among the first to become aware of the devastating effects of careless human interaction with the

natural world. Witnessing firsthand the decimation caused by hide hunters, commercial feather collectors, whalers, big game hunters, and poachers, these museum taxidermists recognized the existential threat to critically endangered species and the urgent need to protect them. The compelling exhibits they created—as well as the scientific field work, popular writing, and lobbying they undertook—established a vital leadership role in the early conservation movement for American museums that persists to this day. Through their individual research expeditions and collective efforts to arouse demand for environmental protections, this remarkable cohort—including William T. Hornaday, Carl E. Akeley, and several lesser-known colleagues—created our popular understanding of the animal world and its fragile habitats. For generations of museum visitors, they turned the glass of an exhibition case into a window on nature—and a mirror in which to reflect on our responsibility for its conservation.

For thousands of years, people have used nature to justify their political, moral, and social judgments. Such appeals to the moral authority of nature are still very much with us today, as heated debates over genetically modified organisms and human cloning testify. *The Moral Authority of Nature* offers a wide-ranging account of how people have used nature to think about what counts as good, beautiful, just, or valuable. The eighteen essays cover a diverse array of topics, including the connection of cosmic and human orders in ancient Greece, medieval notions of sexual disorder, early modern contexts for categorizing individuals and judging acts as "against nature," race and the origin of humans, ecological economics, and radical feminism. The essays also range widely in time and place, from archaic Greece to early twentieth-century China, medieval Europe to contemporary America. Scholars from a wide variety of fields will welcome *The Moral Authority of Nature*, which provides the first sustained historical survey of its topic. Contributors: Danielle Allen, Joan Cadden, Lorraine Daston, Fa-ti Fan, Eckhardt Fuchs, Valentin Groebner, Abigail J. Lustig, Gregg Mitman, Michelle Murphy, Katharine Park, Matt Price, Robert N. Proctor, Helmut Puff, Robert J. Richards, Londa Schiebinger, Laura Slatkin, Julia Adeney Thomas, Fernando Vidal

Today's celebrity conservationists, many of whom made their reputations through television and other visual media, play a major role in drawing public attention to an increasingly threatened world. This book, one of the first to address this contribution, focuses on five key figures: the English naturalist David Attenborough, the French marine adventurer Jacques-Yves Cousteau, the American primatologist Dian Fossey, the Canadian scientist-broadcaster-activist David Suzuki, and the Australian 'crocodile hunter' Steve Irwin. Some of the issues the author addresses include: What is the changing relationship between western conservation and celebrity? How has the spread of television helped shape and mediate this relationship? To what extent can celebrity conservation be seen as part of a global system in which conservation, like celebrity, is big business? The book critically examines the heroic status accorded to the five figures mentioned above, taking in the various discourses – around nature, science, nation, gender – through which they and their work have been presented to us. In doing so, it fills in the cultural, historical and ideological background behind contemporary celebrity conservationism as a popular expression of a chronically endangered world.

The watery terrain of the Albufera Natural Park, an area ten kilometers south of Valencia that is widely regarded as the birthplace of paella, has long been prized by residents and visitors alike. Since the twentieth century, the disparate visions of city dwellers, farmers, fishermen, scientists, politicians, and tourists have made this working landscape a site of ongoing conflict over environmental conservation in Europe, the future of Spain, and Valencian identity. In *Cultivating Nature*, Sarah Hamilton employs the Albuferas contested lands and waters, which have supported and been transformed by human activity for a millennium, as a lens bringing regional, national, and global social histories into sharp focus. She argues that efforts to preserve biological and cultural diversity must incorporate the interests of those who live within heavily modified and long-exploited ecosystems such as the Albufera de Valencia. Shifting between local struggles and global debates, this fascinating environmental history reveals how Franco's dictatorship, Spain's integration with Europe, and the crisis in European agriculture have shaped the Albufera, its users, and its inhabitants.

How should we share the truth about the environmental crisis? At a moment when even the most basic facts about ecology and the climate face contestation and contempt, environmental advocates are at an impasse. Many have turned to social media and digital technologies to shift the tide. But what if their strategy is not only flawed, but dangerous? *The Truth about Nature* follows environmental actors as they turn to the internet to save nature. It documents how conservation efforts are transformed through the political economy of platforms and the algorithmic feeds that have been instrumental to the rise of post-truth politics. Developing a novel account of post-truth as an expression of power under platform capitalism, Bram Büscher shows how environmental actors attempt to mediate between structural forms of platform power and the contingent histories and contexts of particular environmental issues. Bringing efforts at wildlife protection in Southern Africa into dialogue with a sweeping analysis of truth and power in the twenty-first century, Büscher makes the case for a new environmental politics that radically reignites the art of speaking truth to power.
