Richardson Maturity Model—**Martin Fowler**

Richardson Maturity Model (RMM) is a four-level scale that indicates extent of API conformity to the REST framework. The maturity of a service is based on three factors in this model: URI, HTTP Methods and HATEOAS (Hypermedia). If a service employs these technologies, it’s considered more mature.

This model of division of REST services to identify their maturity level – is called Richardson Maturity Model. Richardson used three factors to decide the maturity of a service i.e. URI, HTTP Methods and HATEOAS (Hypermedia). The more a service employs these technologies – more mature it shall be considered. The levels of maturity according to Richardson’s model. In this analysis, Richardson described these maturity levels as below: Level Zero; Level One
