This e-book presents state-of-the-art research projects and opinions on using paleolimnology for lake restoration and management. It illustrates the general idea that proposing adequate restoration and management solutions must be based on the past. Knowing the natural and anthropic variations a water body went through defines the best ways for maintaining or restoring an ecosystem. By quantifying baseline conditions, paleolimnology provides a definite plan for restoration and management. This cannot be achieved without studying the past.

This is an authoritative compilation of information regarding methods and data used in all phases of nuclear engineering. Addressing nuclear engineers and scientists at all levels, this book provides a condensed reference on nuclear engineering since 1958.

"Sustaining Sustainability is an inside story on the state of the art of national strategies for sustainable development in nine EU member states, with a particular focus on the role of national councils for sustainable development (SDC) in producing and implementing SD strategies (SDS). Such councils have been created by national governments, stimulated by the Agenda 21, with the purpose of fostering dialogue for SD among stakeholders, and between stakeholders and government, as well as monitoring progress and encouraging initiatives. The study was financed by the participating councils and supported by EEAC, the European network of advisory councils for environment and sustainable development. All 6 countries in the European Union with a well-established SDC participated (B, D, FIN, IRE, P, UK), plus three countries with environment or other councils engaged in the SD agenda (HUN, NL, S). 7 countries have a SDS and one is currently developing one; some have already seen at least one revision phase. With an in-depth approach the study attempts to look behind the curtains of SD processes."—Executive Summary.

This is the first-ever book-length collection of articles on the subject of prosody and humor. The chapters are written by the recognized leaders in the field and present the cutting edge of the research in this new interdisciplinary field of study. The book covers a broad range of languages, using several theoretical approaches, ranging from cognitive semantic theories, to discourse analysis, and anthropology. All the contributions are anchored in instrumental empirical data analysis. The topics covered range from humor in conversation, to sitcom scripts, from riddles to intonation jokes, from irony in a laboratory setting to irony occurring in conversation, from friends' conversations in France, to business meetings in rural Brazil. The unifying theme is the search for markers of the humorous or ironical intentions of the speakers or of the genre of interaction. Originally published in Pragmatics & Cognition 19:2 (2011) and 19:3 (2011).

In this book, the authors provide insights into the basics of adaptive filtering, which are particularly useful for students taking their first steps into this field. They start by studying the problem of minimum mean-square-error filtering, i.e., Wiener filtering. Then, they analyze iterative methods for solving the optimization problem, e.g., the Method of Steepest Descent. By proposing stochastic approximations, several basic adaptive algorithms are derived, including Least Mean Squares (LMS), Normalized Least Mean Squares (NLMS) and Sign-error algorithms. The authors provide a general framework to study the stability and steady-state performance of these algorithms. The affine Projection Algorithm (APA) which provides faster convergence at the expense of computational complexity (although fast implementations can be used) is also presented. In addition, the Least Squares (LS) method and its recursive version (RLS), including fast implementations are discussed. The book closes with the discussion of several topics of interest in the adaptive filtering field.

In 1909 a short contribution entitled "Geriatrics" was published in the New York Medical Journal. According to this article, old age represents a distinct period of life in which the physiologic changes caused by aging are accompanied by an increasing number of pathologic changes. We now know that the organs of the body age neither at the same rate nor to the same extent and that physiologic alterations are indeed superimposed by pathologic changes; as a result of the latter phenomenon the origins and course of illnesses in the elderly can present unusual characteristics. The frequency of concurrent disorders in the elderly entails the danger of polypragmatic pharmacotherapy, i. e., the use of various drugs to combat various disorders while neglecting the possibly adverse combined effects of these drugs. To obviate this danger, special knowledge in the field of geriatrics, the medical branch of gerontology, is necessary. Geriatrics is constantly increasing in importance owing to the near doubling of life expectancy over the past 130 years and to the improved diagnostic and therapeutic techniques made available by medical progress. The rapid recent development of experimental gerontology has played an essential role in enabling us to understand the special features of geriatrics. This progress has, however, been accompanied by such a vast increase in the volume of literature on the subject that specialists in the field can scarcely maintain an overall perspective of new publications.
