An adjunct to the increased emphasis on developing students' critical thinking and higher order skills is the need for methods to monitor and evaluate these abilities. These papers provide insight into current techniques and examine possibilities for the future. The contributors to Diagnostic Monitoring of Skill and Knowledge Acquisition focus on two beliefs: that new kinds of tests and assessment methods are needed; and that instruction and learning can be improved by developing new assessment methods based on work in cognitive science.

process should be tightly linked throughout education to attain high levels of ability. The longstanding pedagogical assumption that the attainment of useful knowledge proceeds from lower level learning based on the practice of fundamental skills that demand little thought, to higher level competence in which problem solving finally plays an increasing role, is no longer tenable. It is now clear that thinking is not an outcome of basic learning, but is part of the basic acquisition of knowledge and skill. In learning to read, for example, decoding the printed word and understanding simple texts is an act of problem solving, requiring inference and elaboration by the reader. The prevalence of reasoning with information
