Research by cognitive scientist Maria Kozhevnikov discusses a second set of visual thinking skills: the ability to recognize patterns and spatial awareness. I think of this skill set as map creation skills. Both visual thinking skills—painting pictures and map creation—can help us improve our writing and engage readers. Without the need to become accomplished artists. Visual thinking is natural, even for writers.

This paper proposes that the writing problems of such visual thinkers derive from three factors: a lack of words, unfamiliarity with the kind of analysis that leads to the logical sequencing of prose, and; difficulty understanding that context must be communicated. Table 1 summarizes the writing problems of visual thinkers. Visual thinkers have difficulty organizing expository prose because their preferred mode of thought is fundamentally different from the organization of expository prose.

Visual thinking, also called visual/spatial learning or picture thinking is the phenomenon of thinking through visual processing. Visual thinking has been described as seeing words as a series of pictures. It is common in approximately 60–65% of the general population. "Real picture thinkers", those who use visual thinking almost to the exclusion of other kinds of thinking, make up a smaller percentage of the population. Research by child development

institutions nationwide, including bilingual schools in California, West Orange Public Schools in New Jersey, and the San Francisco Museum of Modern Art. It provides for open-ended yet highly structured discussions of visual art, and significantly increases students' critical thinking, language, and literacy skills along the way. Philip Yenawine, former education director of New York's Museum of Modern Art and cocreator of the VTS curriculum, writes engagingly about his years of experience with elementary school students in the classroom. He reveals how VTS was developed and demonstrates how teachers are using art—as well as poems, primary documents, and other visual artifacts—to increase a variety of skills, including writing, listening, and speaking, across a range of subjects. The book shows how VTS can be easily and effectively integrated into elementary classroom lessons in just ten hours of a school year to create learner-centered environments where students at all levels are involved in rich, absorbing discussions.

Is your creative, intelligent, vibrant child struggling in school? Did you have a similar experience when you were in school? You or your child may be visual learners. In a test heavy education system, more and more children are underachieving, feeling lost and misunderstood. Because, schools are focused on teaching left-brain auditory learners and our right-brain visual kids are not getting what they need to succeed. In *Being Visual*, Bette Fetter, the founder of Young Rembrandts, discusses strategies to increase your visual learner's success in school, identifying how... Thinking like Einstein is a refreshing intellectual drink in the drought of contemporary visual literacy. It raises important issues and historical facts that restore the balance-of-power between non-verbal/visual creative thinking and verbal/math creative thinking. The book is a valuable tool that recognizes the potency of data-driven digital visualization and empowers our visual technological futures. It is a must read for any visualization educator.-Professor Donna Cox, Director, Visualization and Experimental Technologies, National Center for Supercomputing Applications, University of Illinois This book is a fascinating look at the history of the relationship between logical and visual thinking. There are aspects to this history that are both frightening and encouraging and, with the current

pendulum swing back towards visualization as a respectable thinking tool, it provides an important guide to what has been done before and what can be done in the future.-Dr. James F. Blinn, Graphics Fellow at Microsoft Research, MacArthur Fellow, and columnist for IEEE Computer GraphicsAlbert Einstein once said that all of his most important and productive thinking was done by playing with images in his imagination. Only in a secondary stage did he translate - with great effort, he says - these images into the language of words and mathematics that could be understood by others.According to Thomas G. West, Einstein was a classic example of a strong visual thinker, a person who tends to think in images and visual patterns, and sometimes has difficulty with words and numbers. In his award-winning book, In the Mind's Eye, West discussed the connections between highly talented, visually oriented persons like Einstein and certain learning disabilities such as dyslexia. Now, in Thinking Like Einstein, West investigates the new worlds of visual thinking, insight, and creativity made possible by computer graphics and information visualization technologies. He argues that, with the rapid spread of inexpensive and powerful computers, we are now at the beginning of a major transition, moving from an old world based mainly on words and numbers to a new world where high level work in all fields will eventually involve insights based on the display and manipulation of complex information using moving computer images.West profiles several highly creative visual thinkers, such as James Clerk Maxwell, Nikola Tesla, and Richard Feynman, pointing out that there is a long history of using visualization rather than words or numbers to solve problems. Citing the longstanding historical conflicts between image lovers and image haters, West examines the relationship of art, scientific knowledge, and differences in brain capabilities - observing how modern

visual thinkers with visualization technologies seem to have learned how to cut through the problems of overspecialization in academia and in the workplace. West predicts that computer visualization technology will radically change the way we all work and think. For thousands of years the technology of writing and reading has tended to promote the dominance of the left hemisphere of the brain, with its linear processing of words and numbers. Now the spread of graphical computer technologies is permitting a return to our visual roots with a new balance between hemispheres and ways of thinking - presenting new opportunities for problem solving and big picture thinking. Thus, he argues that the newest technologies will help us to reaffirm some of our oldest capabilities, allowing us to see previously unseen patterns and to restore a balance in thought and action. Thomas G. West is a writer, lecturer and consultant based in Washington, DC. In connection with In the Mind's Eye, he has been invited to provide over 200 presentations, interviews and documentary segments for computer, business, education, art, design, scientific and medical groups in the U.S. and fourteen countries overseas. Dyslexia and other learning differences are commonly seen as disabilities, but they must also be seen as distinctive abilities, different (and often superior) modes of perceiving and understanding the world. As Thomas West shows, some of our greatest minds, from Einstein and Edison to Churchill and da Vinci, have been visual thinkers who today might be labeled 'learning disabled.' In the Mind's Eye makes a powerful case that the dyslexic-visual mind may be full of creative human potential, and is as crucial a part of our cognitive heritage as any other. -Oliver Sacks, MD, Professor of Neurology and Psychiatry, Columbia University

Medical Center; Columbia University Artist; Author of Musicophilia, Awakenings, and The Man Who Mistook His Wife for a Hat Thomas West brings to life the fascinating capacities and syndromes that arise from our visual-spatial imagination. His book proves beyond doubt that we are not all points on a single bell curve of intelligence.-Howard Gardner, The John H. and Elisabeth A. Hobbs Professor of Cognition and Education, Harvard Graduate School of Education; Author of many books, including Frames of Mind: The Theory of Multiple Intelligences and Intelligence Reframed: Multiple Intelligences for the 21st Century Unfortunately, I did not discover this wonderful book before I wrote Thinking in Pictures several years ago. I recommend it to teachers, parents and education policymakers. West profiles people with dyslexia who are visual thinkers, and his conclusions on the link between visual thinking and creativity are similar to mine.-Temple Grandin, Associate Professor at Colorado State University, Author of the memoir Thinking in Pictures (dealing with her life with autism) and the best-selling Animals in Translation Now in its fifteenth printing, In the Mind's Eye has been recognized as a classic in its field. The book still stands alone as a uniquely compelling argument for the great importance of visual thinking and visual technologies as well as the high creative potential of many individuals with dyslexia or other learning difficulties. In this second edition, Thomas G. West reviews a number of recent developments that support and extend the perspectives and expectations originally set forth in the first edition. In addition to the original eleven portraits of famous individuals with learning difficulties (including Albert Einstein and Thomas Edison), he has added brief profiles of two dyslexic scientists known for their ability to generate, in quite different fields, powerful but unexpected innovations and discoveries: William J. Dreyer, a Caltech professor

Recognized as among the best of the best by the American Library Association in their broad psychology and neuroscience category, this title belongs on the bookshelves of all educators and anyone with an interest in visual thinking, visual technologies, and highly creative people with learning difficulties.
